Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

XX
XX Oligo:nucleotide(s) complementary to HCV 5' untranslated region - used in
PT the treatment and detection of HCV infection, esp. hepatitis and hepato-
PT carcinoma.
XX
XX Claim 1; Page 18; 100p; English.
XX
XX The sequences given in AAT80211-382 represent synthetic oligonucleotides
CC which are complementary to a portion of the 5' untranslated region (UTR)
CC of hepatitis C virus (HCV). These sequences may be used in a
CC pharmaceutical composition for the control or prevention of HCV
CC infection. They may be used to inhibit replication or expression of HCV
CC or for detecting the presence of HCV in a sample. They may be used to
CC inhibit HCV replication in a cell and are therefore useful in the
CC treatment of HCV infections such as chronic and acute hepatitis and
CC hepatocarcinoma

PT PT Oligo:nucleotide(s) complementary to HCV 5' untranslated region - used in
PT the treatment and detection of HCV infection, esp. hepatitis and hepato-
PT carcinoma.
PT PS Claim 1, Page 18, 100pp; English.
PT CC The sequences given in AAT80211-382 represent synthetic oligonucleotides
PT which are complementary to a portion of the 5' untranslated region (UTR)
PT of hepatitis C virus (HCV). These sequences may be used in a
PT pharmaceutical composition for the control or prevention of HCV
PT infection. They may be used to inhibit replication or expression of HCV
PT or for detecting the presence of HCV in a sample. They may be used to
PT inhibit HCV replication in a cell and are therefore useful in the
PT treatment of HCV infections such as chronic and acute hepatitis and
PT hepatocarcinoma.

XX PT Synthetic oligonucleotides complementary to a portion of the 5'
PT untranslated region of hepatitis C virus (HCV), useful for diagnosing and
XX treating HCV infections and hepatocellular carcinoma.
XX PS Claim 1; Page 6; 74pp; English.
XX CC The invention describes synthetic oligonucleotides complementary to a
CC portion of the 5' untranslated region of hepatitis C virus. The
CC oligonucleotides may be used in methods for controlling, preventing, and
CC creating hepatitis C virus infection, in antisense technology and gene
CC therapy, and of detecting the presence of hepatitis C virus in a sample.
CC Hepatitis C virus (HCV) is an enveloped, positive sense, single-stranded
CC RNA virus which infects hepatocytes. HCV is the major cause of non-A, non
CC -B, acute and chronic hepatitis, and has been associated with
CC hepatocellular carcinoma. The invention describes methods and kits for
CC inhibiting replication of HCV, inhibiting the expression of HCV nucleic
CC acid and protein, and for treating HCV infections. This sequence
CC represents a synthetic DNA-RNA hybrid oligonucleotide used for inhibiting
CC HCV replication and expression of HCV

XX Synthetic oligonucleotides complementary to a portion of the 5'  
PT untranslated region of hepatitis C virus (HCV), useful for diagnosing and  
PT treating HCV infections and hepatocellular carcinoma.  
XX  
XX Claim 1, Page 6; 74pp; English.  
PS  
XX The invention describes synthetic oligonucleotides complementary to a  
CC portion of the 5' untranslated region of hepatitis C virus. The  
CC oligonucleotides may be used in methods for controlling, preventing, and  
CC treating hepatitis C virus infection, in antisense technology and gene  
CC therapy, and of detecting the presence of hepatitis C virus in a sample.  
CC Hepatitis C virus (HCV) is an enveloped, positive sense, single-stranded  
CC RNA virus which infects hepatocytes. HCV is the major cause of non-A, non  
CC -B, acute and chronic hepatitis, and has been associated with  
CC hepatocellular carcinoma. The invention describes methods and kits for  
CC inhibiting replication of HCV, inhibiting the expression of HCV nucleic  
CC acid and protein, and for treating HCV infections. This sequence  
CC represents a synthetic DNA-RNA hybrid oligonucleotide used for inhibiting  
CC HCV replication and expression of HCV

XX Oligo:nucleotide(s) complementary to HCV 5' untranslated region - used in

XX the treatment and detection of HCV infection, esp. hepatitis and hepato-

XX carcinoma.  
 XX Claim 1, Page 26, 100pp; English.

XX The sequences given in AAT80211-382 represent synthetic oligonucleotides

CC which are complementary to a portion of the 5' untranslated region (UTR)  
 CC of hepatitis C virus (HCV). These sequences may be used in a  
 CC pharmaceutical composition for the control or prevention of HCV  
 CC infection. They may be used to inhibit replication or expression of HCV  
 CC or for detecting the presence of HCV in a sample. They may be used to  
 CC inhibit HCV replication in a cell and are therefore useful in the  
 CC treatment of HCV infections such as chronic and acute hepatitis and  
 CC hepatocarcinoma. This oligo was used in an RNase H assay to determine  
 CC whether it binds successfully to its target. Three regions of HCV mRNA  
 CC were investigated as RNase sensitive sites. This oligo binds to position  
 CC -88 to -65

PT Detecting hepatitis C virus in biological sample involves amplifying  
 PT reverse transcribed products of virus RNA using amplification primers  
 PT whose sequences correspond to 5' or 3' non-coding region of the virus  
 PT RNA.

PS Claim 30; Page 27; 28pp; English.

CC The present sequence is a probe used in a method for detecting hepatitis  
 CC C virus (HCV) RNA in biological samples. The HCV RNA is reverse  
 CC transcribed to generate cDNA. This is then amplified with primers  
 CC corresponding to the 5' or 3' non-coding region of HCV. The product was  
 CC captured by hybridization to oligonucleotide probes, including the  
 CC present sequence, which were covalently attached to latex particles and  
 CC deposited on the surface of a flow through membrane. The probe/product  
 CC complex was reacted with streptavidin-horseradish peroxidase conjugate,  
 CC which catalyzes the oxidative conversion of a dye precursor to a blue  
 CC dye. The method is useful for the diagnosis of HCV infection in patients,  
 CC in testing the efficacy of anti-HCV therapeutic regimens, and in screening  
 CC blood for HCV-infected samples. The method provides an improved single-  
 CC round, reverse transcription/amplification assay which detects low copy  
 CC levels of HCV RNA. The primers and assay system are designed to allow the  
 CC co-amplification of multiple regions of the HCV genome, multiple viral  
 CC species, and an internal positive control (IPC) RNA (or DNA).  
 CC Simultaneous amplification/detection of multiple regions of the HCV

CC genome increases assay sensitivity and the co-amplification of an IPC  
CC decreases the likelihood of false negative results because of PCR  
CC inhibition

 PT New methods for the simultaneous detection of hepatitis C virus and human  
 immunodeficiency virus in biological samples from humans.  
 CC  
 XX  
 PS Claim 7; Page 23; 45pp; English.  
 CC The specification describes a method for co-detecting Hepatitis C virus  
 (HCV) RNA and human immunodeficiency virus (HIV) RNA in a biological  
 sample. The method uses HCV and HIV specific reverse transcription  
 primers, either separately or in combination. The reverse transcribed  
 products are then amplified using primers specific for the 5' noncoding  
 region of HCV and/or HIV. The presence of specific products indicates the  
 presence of the appropriate RNA in the sample. The method is used for the  
 simultaneous detection of the presence of HCV RNA and HIV RNA in a  
 sample. The present sequence represents a probe specific for HCV

 PT Inhibiting hepatitis C viral RNA replication in an infected cell for  
 treating or preventing viral infection, comprises introducing ribozymes  
 specific for a minus strand of the viral 5' non-coding sequence.  
 PT  
 XX  
 PS Example 2; Col 17; 28pp; English.  
 XX  
 XX  
 CC The present sequence is an oligonucleotide which was used for in solution  
 hybridization to quantitate hepatitis C virus (HCV) RNA following  
 ribozyme expression. Ribozymes were identified that can specifically  
 cleave HCV RNA in a HCV 5' non-coding sequence, the capsid sequence, the  
 NS-5 sequence or any other conserved region of the hepatitis C RNA.  
 CC Ribozymes may be introduced into a cell infected with HCV in order to  
 inhibit HCV RNA replication or expression. Unlike prior art compositions  
 and methods, compositions comprising these ribozymes effectively reduce  
 CC and eradicate HCV from the infected cells and significantly impair the  
 CC ability of the virus to replicate, thus preventing further dissemination  
 CC of the disease. The composition is inherently specific for HCV and has  
 CC negligible toxicity

XX PT Detecting hepatitis C virus in biological sample involves amplifying
XX FT reverse transcribed products of virus RNA using amplification primers
XX PT whose sequences correspond to 5' or 3' non-coding region of the virus
XX FT RNA.
XX PS Claim 30; Page 27; 28pp; English.
XX CC
XX CC The present sequence is a probe used in a method for detecting hepatitis
XX CC C virus (HCV) RNA in biological samples. The HCV RNA is reverse
XX CC transcribed to generate cDNA. This is then amplified with primers
XX CC corresponding to the 5' or 3' non-coding region of HCV. The product was
XX CC captured by hybridisation to oligonucleotide probes, including the
XX CC present sequence, which were covalently attached to latex particles and
XX CC deposited on the surface of a flow through membrane. The probe/product
XX CC complex was reacted with streptavidin-horse radish peroxidase conjugate,
XX CC which catalyses the oxidative conversion of a dye precursor to a blue
XX CC dye. The method is useful for the diagnosis of HCV infection in patients,
XX CC in testing the efficacy of anti-HCV therapeutic regimes, and in screening
XX CC blood for HCV-infected samples. The method provides an improved single-
XX CC round, reverse transcription/amplification assay which detects low copy
XX CC levels of HCV RNA. The primers and assay system are designed to allow the
XX CC co-amplification of multiple regions of the HCV genome, multiple viral
XX CC species, and an internal positive control (IPC) RNA (or DNA).
XX CC Simultaneous amplification/detection of multiple regions of the HCV
XX CC genome increases assay sensitivity and the co-amplification of an IPC
XX CC decreases the likelihood of false negative results because of PCR
XX CC inhibition

 XX PT Identifying a test compound that binds to a target RNA molecule for  
 PT treating or preventing amyloidosis, hemophilia, cancer, gigantism,  
 PT diabetes, by contacting a detectably labeled target RNA molecule with a  
 PT library of test compounds.  
 XX  
 XX  
 XX Example; Page 69; 152pp; English.  
 XX  
 XX The invention relates to a method for identifying a test compound that  
 CC binds to a target RNA molecule, which comprises contacting a detectably  
 CC labelled target RNA molecule with a library of test compounds under  
 CC conditions that permit direct binding of the labelled target RNA to a  
 CC member of the library of test compounds so that a detectably labeled  
 CC target RNA-test compound complex is formed. The method is useful for  
 CC screening libraries of compounds for those that are selectively bind to a  
 CC pre-selected target RNA. The compounds are useful for inhibiting the  
 CC formation of a specific bound RNA-host cell factor complexes in vivo.  
 CC They are also useful for treating or preventing diseases associated with  
 CC overproduction or decreased protein function, such as amyloidosis,  
 CC haemophilia, Alzheimer's disease, atherosclerosis, cancer, gigantism,  
 CC dwarfism, hypothyroidism, hyperthyroidism, autoimmune disorders, aging,  
 CC inflammation, cystic fibrosis, diabetes, obesity, neurodegenerative  
 CC disorders, Parkinson's disease or infections (bacterial, viral, fungal).  
 CC The invention is also used in gene therapy. The present sequence is  
 CC Hepatitis C virus (HCV) internal ribosome entry site (IRES) subdomain  
 CC I11d RNA. This sequence is used to illustrate the method of the invention

 XX PT New immunostimulatory composition, useful in inducing an immune response  
 PT against microbial or cancer antigen or allergen.  
 XX  
 XX Disclosure; SEQ ID NO 4; 220pp; English.  
 XX  
 XX The present sequence is that of a stem-loop forming 27-mer from hepatitis  
 CC C virus (HCV) subdomain I11d. This sequence has been reported to be  
 CC critical in HCV internal ribosome entry site (IRES)-mediated translation.  
 CC The invention relates to immunostimulatory RNA oligomers that contain at  
 CC least one guanine and at least one uracil. Such immunostimulatory RNAs  
 CC are known to occur in the context of an IRES. Claimed immunostimulatory  
 CC RNA oligomers are thought to signal through an MyD88-dependent pathway,  
 CC probably through Toll-like receptor (TLR) 7 or TLR8, and are believed to  
 CC be ligands of TLR7 or TLR8. Claimed immunostimulatory compositions  
 CC comprise a G-U-containing RNA oligomer and optionally an antigen,  
 CC especially an allergen, cancer antigen or microbial antigen. Methods are  
 CC provided for activating an immune cell, inducing an immune response,  
 CC stimulating TLR8 or TLR7 signalling, and supplementing a TLR8- or TLR7-  
 CC mediated immune response. The methods and compositions are useful for  
 CC activating immune cells in vivo, in vitro and ex vivo, treating  
 CC infection, treating cancer, identifying a target receptor, and screening  
 CC for additional immunostimulatory compounds.

XX the treatment and detection of HCV infection, esp. hepatitis and hepato-
XX carcinoma.
XX
XX Claim 1; Page 26; 100pp; English.
XX
XX The sequences given in AAT80211-382 represent synthetic oligonucleotides
XX which are complementary to a portion of the 5' untranslated region (UTR)
XX of hepatitis C virus (HCV). These sequences may be used in a
XX pharmaceutical composition for the control or prevention of HCV
XX infection. They may be used to inhibit replication or expression of HCV
XX or for detecting the presence of HCV in a sample. They may be used to
XX inhibit HCV replication in a cell and are therefore useful in the
XX treatment of HCV infections such as chronic and acute hepatitis and
XX hepatocarcinoma. This oligo was used in an RNase H assay to determine
XX whether it binds successfully to its target. Three regions of HCV mRNA
XX were investigated as RNase sensitive sites. This oligo binds to position
XX -94 to -67

XX
XX Oligo:nucleotide(s) complementary to HCV 5' untranslated region - used in
XX the treatment and detection of HCV infection, esp. hepatitis and hepato-
XX carcinoma.
XX
XX Claim 1; Page 26; 100pp; English.
XX
XX The sequences given in AAT80211-382 represent synthetic oligonucleotides
XX which are complementary to a portion of the 5' untranslated region (UTR)
XX of hepatitis C virus (HCV). These sequences may be used in a
XX pharmaceutical composition for the control or prevention of HCV
XX infection. They may be used to inhibit replication or expression of HCV
XX or for detecting the presence of HCV in a sample. They may be used to
XX inhibit HCV replication in a cell and are therefore useful in the
XX treatment of HCV infections such as chronic and acute hepatitis and
XX hepatocarcinoma. This oligo was used in an RNase H assay to determine
XX whether it binds successfully to its target. Three regions of HCV mRNA
XX were investigated as RNase sensitive sites. This oligo binds to position
XX -90 to -63

XX XX
PS PS Claim 3; Fig 1c; 39pp; English.
XX XX
XX XX The present invention relates to a new computer for producing three
CC CC dimensional representation of a molecule. The computer of the invention
CC CC comprises a machine-readable data storage medium, a working memory for
CC CC storing instructions, a central processing unit coupled to the working
CC CC memory and machine-readable data storage medium and a display coupled to
CC CC the central processing unit. The molecule comprises a hepatitis C virus
CC CC (HCV) internal ribosomal entry site (IRES) element. The invention is
CC CC useful for producing a three dimensional representation of a molecule
CC CC comprising hepatitis B virus C IRES element, for identifying potential
CC CC inhibitors of hepatitis B virus translation and for modelling
CC CC interactions of the IRES with its binding partner, the 40S ribosome
CC CC subunit. The computer generates the three-dimensional graphical
CC CC representations of molecules or their portions from a set of structure co-
CC CC ordinates and displays graphical three-dimensional representation of the
CC CC HCV IRES stem loops in at least one of domain IId or IIle. The
CC CC structural data permits the identification of atoms that are important
CC CC for 40S ribosomal subunit binding. The present nucleic acid sequence
CC CC represents the hepatitis C virus internal ribosome entry site element
CC CC domain IId of the invention. This sequence represents residues 252-280
CC CC of ABK15309

XX
XX New large comb-type branched polynucleotides - useful as amplification
XX multimers in nucleic acid hybridisation assays.
XX
XX Example 6; Col 25; 33pp; English.
XX
XX The invention relates to a large comb-type branched polynucleotide of
XX formula 3'-A-S-(S'-X')m-S'-5'; where X' is a branched site joined to -
XX (R)n-S'-E-L; A = an oligonucleotide complementary to an analyte nucleic
XX acid sequence; S = a first spacer segment of 1-50 linked monomers where
XX each monomer is selected from nucleotides and a cleavable linker R; S' =
XX a branching site spacer segment of 0-15 linked monomers where each of the
XX monomers is selected from nucleotides and cleavable linker R; X' = a
XX multifunctional nucleotide that provides a branch site; m = 1-100; S' =
XX a second spacer segment of 0-10 linked monomers where each of the
XX monomers is selected from nucleotides and cleavable linker R; R = a
XX cleavable linker molecule; n = 0 or 1; S'' = a third spacer segment of 0
XX -10 linked monomers where each of the monomers is selected from
XX nucleotides and cleavable linker R; E = an oligonucleotide segment of 5-
XX 10 nucleotides; L = an oligonucleotide containing 2-10 iterations of a
XX nucleotide sequence complementary to a labelled nucleic acid probe. The
XX invention also relates to a branched nucleic acid polymer. The poly-
XX nucleotides are useful as amplification multimers in nucleic acid
XX hybridisation assays used for genetic research, biomedical research and
XX clinical diagnostics. Since the polynucleotide multimers include a large
XX number (at least 20) iterations of a sequence that are available for
XX specific hybridisation, they permit a greater degree of amplification and
XX decrease the threshold level of a detectable analyte. The present
XX sequence represents a hepatitis C virus (HCV) amplifier probe. (Updated

PT Improved nucleic acid hybridisation assays - using large comb-type  
PT polypeptide(s).

PS Example 6; Col 24; 31pp; English.

XX Oligonucleotides AAV83063-80 represent amplifier probes, used in a  
CC sandwich hybridisation assay for Hepatitis C virus (HCV) DNA. The

CC sandwich hybridisation assay utilises the comb-type branched  
CC polynucleotide amplification multimer of the invention. This large comb-

CC type branched polynucleotide comprises a polynucleotide backbone having  
CC at least 15 multifunctional nucleotides each defining a sidechain site

CC and pendant polynucleotide sidechains extending from the multifunctional  
CC nucleotides, each comprising iterations of a single stranded

CC oligonucleotide unit capable of binding specifically to a second single-  
CC stranded polynucleotide sequence. The total number of iterations in all

CC sidechains is at least 20. The first single-stranded polynucleotide  
CC sequence is a labelled polynucleotide, directly or indirectly linked to a

CC nucleic acid analyte. In the nucleic acid hybridisation assay of the  
CC invention, the labelled nucleic acid probe is hybridised to the branched

CC polymeric nucleotide via the second single-stranded oligonucleotide unit.  
CC The comb-type branched polynucleotides are used as amplification

CC multimers in nucleic acid hybridisation assays and other assays such as  
CC direct, indirect and sandwich assays

PT Determining presence or absence of a predetermined endogenous nucleic  
PT acid sequence by using an enzyme that depolymerizes the 3' end of an

PT oligonucleotide probe hybridized to a target sequence to release  
PT identifier nucleotides.

PS Example; Page 349; 389pp; English.

XX The present invention describes a method (M1) for determining the  
CC presence or absence of a predetermined endogenous nucleic acid target

CC sequence (ENMT). The method comprises hybridising a probe having an  
CC identifier nucleotide (IN) with ENMT which is treated with an enzyme that

CC depolymerises the 3' end of hybridised NA to release the INs. M1 is used  
CC for determining the number of known sequence repeats present in a nucleic

CC acid target sequence in a nucleic acid sample. The method is also useful  
CC for determining whether a nucleic acid target sequence in a sample is an

CC allele from a homozygous or heterozygous locus. The method is also useful  
CC for detection of mutations, translocations and SNPs in nucleic acids

CC (including those associated with genetic disease), determination of viral  
CC load, species identification, sample contamination, and analysis of

CC forensic samples. AAA86971 to AAA87079 and AAA812817 represent sequence  
CC which are used in the exemplification of the present invention. N.B.

CC There is a discrepancy between the SEQ ID NO: and sequences given in the  
CC examples, and the SEQ ID NO: and sequences given in the sequence listing

PT Detecting the presence of predetermined exogenous nucleic acid target  
 PT sequence useful for e.g. genotyping, comprises depolymerizing the 3' end  
 PT of an oligonucleotide probe hybridized to a nucleic acid target sequence.  
 XX  
 PS Claim 47; Page 185; 230pp; English.

CC The present sequence is a probe which was used to interrogate hepatitis C  
 CC virus (HCV) RNA isolated from infected or uninfected human serum samples.  
 CC The probe was used to determine the viral load of the samples. This was  
 CC performed as part of a method for determining the presence of a known  
 CC exogenous nucleic acid target sequence in a nucleic acid sample. The  
 CC method comprises admixing a treated sample with a depolymerizing enzyme  
 CC which releases one or more nucleotides from the 3'-end of a hybridised  
 CC nucleic acid probe. The method is used for assaying nucleic acids for a  
 CC particular native or mutant sequence, and for genomic typing. It is  
 CC useful for detecting mutations, translocations, and single nucleotide  
 CC polymorphisms, determination of viral load, species identification,  
 CC detection of sample contamination, and analysis of forensic samples.  
 CC Compared with previous methods of detecting nucleic acid hybrids, the new  
 CC method has higher sensitivity without the need for radiochemicals or  
 CC electrophoresis. It is quantitative, highly reproducible and can be  
 CC automated. The method can reliably detect as few as 10 copies of a virus  
 CC in a sample, and is capable of providing multiple analyses in a single  
 CC assay (multiplex assay)

 PT Self-assembly formed from amplified target gene and probe pairs for  
 PT sample and accurate detection of the target gene.  
 XX  
 PS Example Examples; Page 35; 123pp; Japanese.

CC The invention relates to a method for forming an oligonucleotide self-  
 CC assembly, in which oligonucleotides containing a target gene sequence are  
 CC first amplified by a conventional gene amplification method, and the  
 CC amplification product is then incorporated into the self-assembly by  
 CC reaction with one or more oligonucleotide probe pairs. Also disclosed is  
 CC the detection of a specific gene using the novel method. The  
 CC oligonucleotide probe pairs (which may consist of one pair, or two or  
 CC more different pairs) consist of at least three distinct hybridising  
 CC regions which are each complementary to a region on the other probe of  
 CC the pair, or to a region on the target oligonucleotide. Preferably each  
 CC complementary region includes at least one G-C coupling. The regions  
 CC of the probe sequence and those complementary to the target  
 CC oligonucleotides at outer parts of the probe sequence. The self-assembly  
 CC is formed by first forming a dimer of the probe pair, by hybridisation of  
 CC the central complementary regions of the probes. This dimer is then  
 CC hybridised with the target oligonucleotides, each 3' or 5' terminal  
 CC portion of the probe dimer hybridizing to a different region on one or  
 CC other strand of the target oligonucleotide sequence. The probes may be  
 CC DNA, RNA, PNA or LNA. The 3' and/or 5' terminals of the probes may be  
 CC methylated. The oligonucleotides may be synthesised in the initial  
 CC amplification reaction from single or double stranded DNA or RNA and the  
 CC synthesis may include ligation of a target sequence to sequences  
 CC complementary to the probe pairs. They may be enzymatically cleavable by  
 CC exonuclease, kinase H or restriction enzymes. This method is an accurate  
 CC specific and sensitive method for the detection of a target gene sequence  
 CC at low cost and without complicated procedures or apparatus. The current  
 CC sequence represents a synthesised bridge probe utilised in an example  
 CC from the invention.

PT Amplifying nucleic acid for detecting nucleic acid, by extension of one or more primers using target templates having replication terminating feature, dissociation of primer from templates to produce multiple extended primers.

PS Example; SEQ ID NO 19; 75pp; English.

The invention relates to amplifying (M1) a nucleic acid, involving (TT) contacting one or more extension primers (EP) and target templates (CC) and incubating under conditions to promote interaction of (EP) and templates, extension of (EP) using the interacting (TT), and dissociation of the extended (EP) from (TT), to produce multiple extended (EP) from at least one (TT), where each (TT) comprise a replication terminating feature. In (M1), (EP) and target templates are incubated under isothermal conditions or single set of conditions. The target templates are nucleic acid sequences of interest. Each of (EP) comprises or consists of a target complement portion, preferably nucleotides, where the nucleotides consist of the target complement portion. Each (EP) further comprises non-target complement portion. The method is known as TmX (thermodynamic equilibrium extension of primers). The method is useful for amplifying nucleic acid and for detecting nucleic acid sequences which involves performing (M1), and detecting one or more of the extended (EP). In (M1), only those sequences targeted by (EP) are amplified, thus allowing specific sequences to be targeted for amplification. Flexibility in the location of replication terminating feature allows flexibility in targeting sequences. If a targeted sequence is not present, the sequence will not be amplified. Multiple sequences can be amplified in the same reaction by targeting multiple sequences with (EP). Simultaneous amplification and detection is facilitated using detection probes associated with a substrate. Multiplex detection can be facilitate by an array of detection probes with different detection probes at different locations of a substrate. The present sequence is a synthetic template sequence used to demonstrate the method of the invention.

PT Soln. phase sandwich hybridisation assays for nucleic acid(s) - with  
 PT capture extender molecules or competitive oligo:nucleotide(s) to minimise  
 PT background signal, increasing sensitivity and selectivity.  
 PS Example 1; Page 33; 86bp; English.  
 CC AAQ98098-098099 are capture extender probes (CEs) used in a new improved  
 CC method of solution phase sandwich hybridisation assays. The capture  
 CC extender probes contain an analyte binding sequence (ABS) and a support  
 CC binding sequence (SBS) which hybridise to a sequence present in a capture  
 CC probe when immobilised on a solid support. The analyte binding sequences  
 CC are different in each capture extender probe and the capture probes  
 CC contain two CE-binding sequences, so that two different CE can bind to a  
 CC single capture probe. The new method minimises background signals (caused  
 CC by non-specific hybridisation), this improves both sensitivity and  
 CC selectivity of the assay without increasing cost or time

PS Disclosure; Page 9; 18pp; English.  
XX  
XX The present invention describes a polynucleotide array (1), which  
CC comprises a first set of multiple features, where each feature  
CC independently has first polynucleotide molecules (PM1) of at least 400  
CC nucleotides in length, and a second set of features, where each feature  
CC independently has second polynucleotide molecules (PM2) of no more than  
CC 100 nucleotides in length. Also described: (1) a kit comprising (1) and  
CC polynucleotide controls which are, or their complements are, at least 70%  
CC complementary to sequences of respective second polynucleotides; and (2)  
CC fabricating (M) a polynucleotide array, by forming a first set of  
CC multiple features on a substrate, with each feature independently having  
CC PM1 and forming a second set of features on the substrate, with each  
CC feature independently having PM2. (1) is useful in a method involving  
CC exposing (1) to control targets, such that the control targets hybridise  
CC at least 100 times more efficiently to respective second features than  
CC they do to any of the first features, and simultaneously exposing (1) to  
CC a sample, where the second set of features hybridise more efficiently  
CC with control targets than any of the first set features hybridise to any  
CC control targets. The method further involves reading the array to obtain  
CC an image representing the amount of polynucleotides which have bound to  
CC first and second set features, and evaluating locations of first features  
CC in the image using the locations of second features in the image. (1) is  
CC useful in diagnostic, screening, gene expression analysis, and other  
CC applications. (1) is also useful for detecting polymorphisms or splice  
CC variants. The present sequence represents a Hepatitis C virus control  
CC features related 60-mer oligonucleotide, designated HCV0188, which is  
CC given in the exemplification of the present invention

 CC assembly, in which oligonucleotides containing a target gene sequence are  
 CC first amplified by a conventional gene amplification method, and the  
 CC amplification product is then incorporated into the self-assembly by  
 CC reaction with one or more oligonucleotide probe pairs. Also disclosed is  
 CC the detection of a specific gene using the novel method. The  
 CC oligonucleotide probe pairs (which may consist of one pair, or two or  
 CC more different pairs) consist of at least three distinct hybridising  
 CC regions which are each complementary to a region on the other probe of  
 CC the pair, or to a region on the target oligonucleotide. Preferably each  
 CC complementary region includes at least one G-C coupling. The regions  
 CC of the probe sequence and those complementary to the target  
 CC oligonucleotides at outer parts of the probe pair may be in the internal part  
 CC of the probe sequence and those complementary to the target  
 CC oligonucleotides at outer parts of the probe pair, by hybridisation of  
 CC hybridised with the target oligonucleotides, each 3' or 5' terminal  
 CC portion of the probe dimer hybridizing to a different region on one or  
 CC other strand of the target oligonucleotide sequence. The probes may be  
 CC DNA, RNA, PNA or LNA. The 3' and/or 5' terminals of the probes may be  
 CC methylated. The oligonucleotides may be synthesised in the initial  
 CC amplification reaction from single or double stranded DNA or RNA and the  
 CC complementary may include ligation of a target sequence to sequences  
 CC complementary to the probe pairs. They may be enzymatically cleavable by  
 CC exonuclease, RNase H or restriction enzymes. This method is an accurate,  
 CC specific and sensitive method for the detection of a target gene sequence  
 CC at low cost and without complicated procedures or apparatus. The current  
 CC sequence represents a synthesised bridge probe utilised in an example  
 CC from the invention.

PT Self-assembly formed from amplified target gene and probe pairs for  
 XX simple and accurate detection of the target gene.  
 PS

XX Example Examples; Page 34-35; 123pp; Japanese.

XX The invention relates to a method for forming an oligonucleotide self-  
 CC assembly, in which oligonucleotides containing a target gene sequence are  
 CC first amplified by a conventional gene amplification method, and the  
 CC amplification product is then incorporated into the self-assembly by  
 CC reaction with one or more oligonucleotide probe pairs. Also disclosed is  
 CC the detection of a specific gene using the novel method. The  
 CC oligonucleotide probe pairs (which may consist of one pair, or two or  
 CC more different pairs) consist of at least three distinct hybridising  
 CC regions which are each complementary to a region on the other probe of  
 CC the pair, or to a region on the target oligonucleotide. Preferably each  
 CC complementary region includes at least one G-C coupling. The regions  
 CC of the probe sequence and those complementary to the target  
 CC oligonucleotides at outer parts of the probe pair may be in the internal part  
 CC of the probe sequence and those complementary to the target  
 CC oligonucleotides at outer parts of the probe pair, by hybridisation of  
 CC hybridised with the target oligonucleotides, each 3' or 5' terminal  
 CC portion of the probe dimer hybridizing to a different region on one or  
 CC other strand of the target oligonucleotide sequence. The probes may be  
 CC DNA, RNA, PNA or LNA. The 3' and/or 5' terminals of the probes may be  
 CC methylated. The oligonucleotides may be synthesised in the initial  
 CC amplification reaction from single or double stranded DNA or RNA and the  
 CC complementary may include ligation of a target sequence to sequences  
 CC complementary to the probe pairs. They may be enzymatically cleavable by  
 CC exonuclease, RNase H or restriction enzymes. This method is an accurate,  
 CC specific and sensitive method for the detection of a target gene sequence  
 CC at low cost and without complicated procedures or apparatus. The current  
 CC sequence represents a synthesised bridge probe utilised in an example  
 CC from the invention.

XX
DR Quantitating target nucleic acid involves competitively amplifying target
PT nucleic acid and reference sequences containing homologous sequences with
PT respect to target, and determining amplified product obtained for the
PT sequences.
XX
PS Claim 6; SEQ ID NO 3; 26pp; Japanese.
XX
CC This invention relates to a novel method for quantitating the amount of
CC target nucleic acid molecules present in a sample. Specifically, it
CC refers to competitively amplifying (using the same primer set) the target
CC oligonucleotides and a number of reference sequences that are partially
CC homologous to the target, where the concentration for each set is equal
CC and amplified product obtained for each type of sequence can be
CC determined and measured. The present invention describes this method as
CC useful for quantitating target nucleic acids such as those derived from a
CC viral genome or mRNA, in order to establish the presence and identity of
CC a viral infection, as well as the degree of viremia. Accordingly, the
CC method also enables measurement of the degree of responsiveness following
CC treatment with a medicament by measuring target mRNA in the subject. This
CC polynucleotide sequence is reference DNA from the hepatitis C virus that
CC shares partial homology with the target nucleic acid of the invention.

PT	PT	Ligation dependent polymerase chain reaction - for the detection of	
XX	PS	Infectious pathogens and abnormal human genes, e.g. HIV and neoplasia.	
XX	XX	Example 8; Page 62; 100P; English.	
CC	CC	A novel method of detecting a target nucleic acid (TNA) sequence involves	
CC	CC	use of the ligase dependent polymerase chain reaction method (LD-PCR). In	
CC	CC	this method, two probes are provided. The first probe contains a region	
CC	CC	at the 5' end which is complementary and will hybridise with the TNA, the	
CC	CC	3' end of the first probe is generic and is bound to one half of a ligand	
CC	CC	binding pair (LBP). The second probe contains a region at the 5' end	
CC	CC	which is complementary to a region in the TNA which is immediately	
CC	CC	adjacent to the complementary region of the first probe. When the probes	
CC	CC	are bound to the TNA, they can be ligated together using a conventional	
CC	CC	ligase. The TNA:ligated probe complex can be isolated by binding the	
CC	CC	first probe to a paramagnetic bead to which is attached the second half	
CC	CC	of the LBP. The TNA can be dissociated from the ligated probe complex	
CC	CC	which can then be detected either by a label attached to the second	
CC	CC	probe, by using an external probe or by PCR using the ligated probes as a	
CC	CC	template. The capture probes AAT09176-7 are used to isolate a region of	
CC	CC	the Hepatitis C virus 5' untranslated region. This probe can be used to	
CC	CC	detect this region by hybridisation such that the 5' and 3' ends of the	
CC	CC	probe lie adjacent to each other when hybridised to the TNA, resulting in	
CC	CC	closed circular mol. after ligation. The ligated sequence can	
CC	CC	subsequently be detected by PCR amplification with the primers AAT09181-2

 XX  
 PT Detection of target nucleic acids in samples - using capture and  
 PT amplification probes, paramagnetic particles and ligation to form a  
 XX nucleotide sequence which can be detected.  
 XX

XX Example 8; Page 70; 136pp; English.

XX The present sequence represents a probe used in an example of the present  
 CC invention for the detection of HCV RNA in a sample. The present invention  
 CC describes methods for: (A) detecting a target nucleic acid (NA) in a  
 CC sample; (B) in situ detection of a target NA in a sample; (C) detecting  
 CC an antigen in a sample; and (D) detecting an antibody in a sample. The  
 CC methods can be used for the rapid automated detection and monitoring of  
 CC pathogenic organisms, as well as the detection of abnormal genes in an  
 CC individual. The methods allow for isolation, amplification and detection  
 CC of NA sequences corresponding to the target NA to be carried out in the  
 CC same receptacle, e.g. tube or micro-well plate. The method also allows  
 CC for standardisation of conditions, because only a pair of generic  
 CC amplification probes may be utilised in the present method for detecting  
 CC a variety of target NAs, thus allowing efficient multiplex amplification.  
 CC The method also allows the direct detection of RNA by probe amplification.  
 CC without the need for DNA template production. The amplification probes,  
 CC which may be covalently joined end to end, form a contiguous ligated  
 CC amplification sequence. The assembly of the amplifiable DNA by ligation  
 CC increase specificity, and makes possible the detection of a single  
 CC mutation in a target

 XX  
 PT Detection of target nucleic acids in samples - using capture and  
 PT amplification probes, paramagnetic particles and ligation to form a  
 XX nucleotide sequence which is amplified.  
 XX

PS Example 8; Page 67; 142pp; English.

XX The present sequence represents a probe, designated Amp-probe-2 (HCV C),  
 CC used for detecting the 5' untranslated region (5' UTR) of Hepatitis C  
 CC virus RNA. Nucleotides 1-26 at the 5' end of the probe are complementary  
 CC to a portion of the 5'UTR of the HCV genome. The probe is used to  
 CC exemplify the method of the invention, which describes the detection of a  
 CC target nucleic acid in a sample. The method comprises contacting the  
 CC paramagnetic particles coated with a ligand binding moiety. Each  
 CC capture/amplification probe has a ligand bound to its non-complementary  
 CC sequence that is capable of binding to and forming an affinity pair with  
 CC the ligand binding moiety coated onto the paramagnetic particles. The  
 CC oligonucleotide probes also comprise a probe that can be circularised, by  
 CC having the 3' and 5' ends ligated together. The circularised probe is  
 CC amplified with a DNA polymerase having strand displacement activity under  
 CC conditions whereby an extension primer is extended around the circle for  
 CC multiple revolutions to form a single stranded DNA of repeating units  
 CC complementary to the sequence of the circular probe, and multiple copies  
 CC of a second extension primer hybridise to complementary regions of the  
 CC single stranded DNA and are extended by the DNA polymerase to provide  
 CC extension products. The extension products of the second extension primer  
 CC displace downstream copies of the second extension primer and  
 CC corresponding extension products to provide displaced single strands to  
 CC which multiple copies of the first extension primer bind and are extended  
 CC by the DNA polymerase. The amplified DNA is detected. The method can be  
 CC used for the rapid automated detection and monitoring of pathogenic  
 CC organisms as well as the detection of abnormal genes in an individual.

CC oligonucleotide probe under conditions that allow hybridisation between  
 CC complementary sequences in the target nucleic acid and the circular  
 CC oligonucleotide probe, adding at least one forward primer comprising a  
 CC sequence complementary to a portion of the circular oligonucleotide  
 CC probe, adding an oligonucleotide primer pair comprising a first primer  
 CC and a second primer where the first primer of the pair comprises a first  
 CC sequence that is substantially identical to a portion of the circular  
 CC oligonucleotide probe, a second sequence that is complementary to the  
 CC second primer of the pair, and a signal generating moiety, the second  
 CC primer of the pair comprises a sequence that is complementary to the  
 CC first primer and a moiety capable of quenching, masking or inhibiting the  
 CC activity of the signal generating moiety, and when the first primer and  
 CC the second primer are bound to one another, the signal is inhibited,  
 CC adding at least one reverse primer comprising a sequence that is  
 CC substantially identical to a portion of the circular oligonucleotide  
 CC probe, adding a DNA polymerase, and amplifying the circular  
 CC oligonucleotide probe and separating the signal generating moiety and the  
 CC quenching, masking or inhibitory moiety to generate a signal, where  
 CC the detection of signal indicates the presence of the target nucleic acid in  
 CC the sample. Also included are a kit for (M1) and amplifying (M2) a  
 CC circular nucleic acid sequence. In (M1), the circular oligonucleotide  
 CC probe is formed by ligating the 3' and 5' ends of linear oligonucleotide  
 CC sequences, comprising 3' and 5' ends regions complementary to adjacent  
 CC hybridisation between complementary sequences in the target nucleic acid  
 CC and the linear oligonucleotide probe. The circular probe is amplified  
 CC using an amplification method chosen from polymerase chain reaction,  
 CC strand displacement amplification, transcription mediated amplification,  
 CC ramification-extension amplification method (RAM) and primer extension.  
 CC (M1) is useful for detecting a target nucleic acid in a sample. (M2) is  
 CC useful for amplification of genomic DNA and total mRNAs expressed in  
 CC cells and for analysing differential mRNA expression. (M1) is useful for  
 CC detecting genetic variations in nucleic acids in sample from patients  
 CC with genetic diseases or neoplasia. The DNA and/or mRNA amplified by (M2)  
 CC is used in techniques developed for detection of infectious agents, and  
 CC detection of normal and abnormal genes. (M1) is used in clinical assays  
 CC as to detect and monitor pathogenic microorganisms in a test sample, as well  
 CC as to detect abnormal genes in an individual. (M1) is useful for routine  
 CC diagnostic testing in a clinical laboratory setting. The present sequence  
 CC is an amplification probe used to demonstrate the above methods.

XX
CC The present sequence is a specifically claimed example of RNA that is
CC complementary (i.e. antisense) to part of the 5'-untranslated region of
CC the hepatitis C virus genome sequence contained in clone 2-1. The 5'-UTR
CC includes several stem-loop sequences. The antisense RNA is useful for
CC inhibiting expression of HCV structural genes and thereby inhibiting
CC viral replication in vivo. The antisense therapy can be used in addition
CC to conventional interferon treatment of HCV infections

The present sequence represents Hepatitis C virus (HCV) 5'-UTR domain III RNA probe used in a RNA electrophoretic gel mobility shift assay (EMSA). The present sequence is described in an invention relating to a novel compound comprising nucleotide sequences capable of annealing and which is derived from a 5'-untranslated region (UTR) of HCV which is essential for binding of eIF3 (eukaryotic initiation factor 3). The invention particularly relates to a sub-region of the HCV 5'-UTR referred to as the minimal internal ribosome entry site (IRES) which can be used to identify drugs which inhibit HCV translation initiation. The compounds of the invention may be used to screen for potential HCV antiviral compounds. Assays based on the IRES enable potential antivirals to be screened in a cheaper and easier way. It allows rapid assaying with a small volume of material and are suitable to parallel processing.

CC of hepatitis C virus (HCV) samples from 18 blood donors and other HCV  
CC variants. Analysis of this region revealed the existence of three  
CC distinct groups of HCV differing by 9-14% in nucleotide sequence. Two of  
CC the groups identified were similar to those of HCV variants termed type 1  
CC and 2, whilst the third appeared to represent a novel virus type.  
CC Comparison of other regions of the genome, eg. the NS-5 region (see also  
CC AA37923-26), showed a high degree of sequence diversity with type 3  
CC being phylogenetically different to type 1 and 2. The same degree  
CC differentiation was noted in the NS-3 (see AA37927-30) and core region  
CC (see AA37931) between type 3 and type 1 sequences. (Updated on 25-MAR-  
CC 2003 to correct PN field.)

PT New oligo ribonucleotide or peptide nucleic acid capable of sequence-  
PT specifically binding with RNA of hepatitis C virus, useful for inhibiting  
PT proliferation of hepatitis C virus and useful as hepatitis C virus  
PT therapeutic agent.  
XX  
PS Example 6; SEQ ID NO 53; 80pp; Japanese.  
XX  
CC The invention relates to an oligo ribonucleotide or peptide nucleic acid  
CC (I) capable of sequence-specifically binding with RNA of hepatitis C  
CC virus (HCV), and comprising a sequence hybridising under stringent  
CC conditions with RNA of HCV. The method of the invention relates to the  
CC inhibition of the proliferation of HCV. The oligo ribonucleotide or  
CC peptide nucleic acid of the invention is useful for inhibiting the  
CC proliferation of HCV which involves contacting (I) with RNA of HCV. (1)  
CC is useful as a therapeutic agent of hepatitis C. The current sequence  
CC represents a PCR product from an example of the invention.

XX
XX Formulating molecular probes, useful for diagnosis and therapy, by
PT analyzing the forms of presentation of targets in organisms.
XX
XX Disclosure; Fig 1; 25pp; French.
XX
XX The specification describes a process for formulating and selecting non-
CC contagious molecular probes which are used for detecting nucleic acids.
CC The process that takes account of the forms of presentation of cellular
CC organisms during the life cycle, or where these forms depend on different
CC chemical, biological and physical states of the organism. The process is
CC a contamination free diagnostic method for direct quantitative and
CC qualitative analysis and gene typing of infectious agents without prior
CC DNA or RNA extraction. The probes enable detection of nucleic acids in
CC sections of living or immobilised, frozen or fixed tissues. Probes of the
CC invention are useful for detecting viral (including oncogenic),
CC bacterial, animal and plant nucleic acid, e.g. in situ hybridization for
CC detecting presence of (pathogenic) microbes and/or determination of
CC genotype, as primers for polymerase chain reaction amplification and
CC therapeutically for blocking replication of pathogens, e.g. as ribozymes.
CC Particularly, the probes are used to detect retroviral particles
CC circulating in body fluids or present in cells. The present sequence
CC represents a sequence comprising a consensus endodogmatic
CC sequence/consensus exodogmatic sequence

XX Detecting a substance in a liquid sample, using detector nucleic acid
PT

```

PT which is amplified and detected, is more sensitive than a comparable  
PT ELISA and is useful to detect prion protein or lectin.  
XX  
PS Example 2; Page 35; 44pp; German.  
XX  
CC This invention describes a novel method of detecting a substance in a  
CC test sample. The method comprises forming a detector complex, in which  
CC the substance is bound to a connection agent conjugated to a detector  
CC nucleic acid which is replicated with a replication agent. A competitor  
CC nucleic acid which competes for the replication agent is also added and  
CC replication of the detector and competitor nucleic acids is determined.  
CC Preferably two or more binding reagents and/or two or more detector  
CC nucleic acids are used. The detected substance is preferably immobilised  
CC on a solid surface. Preferably the substance is bound to an immobilised  
CC binding reagent connected to a first immobilised nucleic acid, which is  
CC hybridised to a second nucleic acid bound to a solid surface. A negative  
CC control is preferably also performed using the detector and competitor  
CC nucleic acids in the absence of the substance and the mix of replicated  
CC detector and competitor nucleic acids in the sample test compared to the  
CC negative control test. The method is useful for detecting a substance,  
CC particularly a prion protein or a lectin in a liquid and is more  
CC sensitive than a comparable ELISA. This sequence represents  
CC polynucleotide fragment KF-2 which is a competitive inhibitor of murine  
CC IGG designated DNA-169, used in an assay described in the invention.

PT Detecting a mutation, useful in diagnosing and treating e.g. cancer or  
PT hepatitis, comprises generating fragments of polynucleotides using  
PT specific primers and measuring molecular weight of cleaved fragments.  
XX  
PS Example 4; SEQ ID NO 19; 58pp; English.  
XX

CC The invention relates to detecting a mutation. The method involves  
CC amplifying a target polynucleotide using a forward primer and a reverse  
CC primer; generating fragments of two or more single-stranded  
CC polynucleotides including one or more mutations sequence having the size  
CC of 2-32 bases by cleaving the amplified target polynucleotide with  
CC restriction enzymes, where the second restriction enzyme does not react  
CC while a first restriction enzyme is reacted with the amplified  
CC polynucleotide; and measuring the molecular weight of the cleaved  
CC fragments. The polynucleotide is cleaved to include one mutation among  
CC two or more different mutations in only one single stranded  
CC polynucleotide fragment and all mutations in the other single stranded  
CC nucleotide fragment. Restrictions enzyme treatment step is performed  
CC using restriction enzymes having different optimum temperatures. The  
CC method is useful in detecting a mutation. The method and primer are  
CC useful in diagnosing, prognosing, treating and preventing a disease, e.g.  
CC cancer or hepatitis B or C virus. The present sequence represents a HCV  
CC template DNA sequence.

PS Example 4; SEQ ID NO 23; 58pp; English.  
XX  
CC The invention relates to detecting a mutation. The method involves  
CC amplifying a target polynucleotide using a forward primer and a reverse  
CC primer; generating fragments of two or more single-stranded  
CC polynucleotides including one or more mutations sequence having the size  
CC of 2-32 bases by cleaving the amplified target polynucleotide with  
CC restriction enzymes, where the second restriction enzyme does not react  
CC while a first restriction enzyme is reacted with the amplified

CC polynucleotide; and measuring the molecular weight of the cleaved  
 CC fragments. The polynucleotide is cleaved to include one mutation among  
 CC two or more different mutations in only one single stranded  
 CC polynucleotide fragment and all mutations in the other single stranded  
 CC nucleotide fragment. Restrictions enzyme treatment step is performed  
 CC using restriction enzymes having different optimum temperatures. The  
 CC method is useful in detecting a mutation. The method and primer are  
 CC useful in diagnosing, prognosing, treating and preventing a disease, e.g.  
 CC cancer or hepatitis B or C virus. The present sequence represents a PCR  
 CC amplified HCV DNA fragment.

PT Detection and characterisation of nucleic acid sequences - by mixing a  
 PT folded target and one or more probes to form a probe/folded target  
 PT complex and detecting and characterising the complexes.

PS Example 5; Page 172-173; 279pp; English.

CC The invention relates to methods and compositions of detection and  
 CC characterisation of nucleic acid sequences and sequence changes. One  
 CC method of detection and characterisation comprises: (a) providing: (i) a  
 CC folded target having a DNA sequence comprising at least 1 double stranded  
 CC region and at least 1 single stranded region; and (ii) at least 1 probe  
 CC complementary to at least a portion of the folded target; and (b) mixing  
 CC the target and probes so that the probe hybridises to form a probe  
 CC /folded target complex. Also provided are methods for determination of  
 CC structure formation in nucleic acid targets; for analysing folded nucleic  
 CC acids targets; and for analysis of nucleic acid structures. The methods  
 CC can be used for the detection and characterisation of nucleic acid  
 CC sequences to detect the presence of pathogenic nucleic acid sequences  
 CC indicative of an infection, the presence of variants or alleles of  
 CC mammalian genes associated with disease and cancers, and the  
 CC identification of the source of nucleic acids found in forensic samples,  
 CC as well as in paternity determinations. The methods allow simultaneous  
 CC analysis of both strands (e.g. the sense and antisense strands) and are  
 CC ideal for high-level multiplexing. The products produced are amenable to  
 CC qualitative, quantitative and positional analysis. The methods may be  
 CC performed in solution or in the solid phase (e.g. on a solid support).

CC The methods are powerful in that they allow for analysis of longer  
CC fragments of nucleic acid than current methodologies. Sequences AAV70453-  
CC 61 represent partial sequences of different amplicons of hepatitis C  
CC virus (HCV) subtypes 1a, 1b, 2c and 3a. These partial sequences are used  
CC for identifying the HCV subtypes

PT Analyzing nucleic acids, comprises mixing target nucleic acid such as  
PT hepatitis C virus nucleic acid, bridging oligonucleotide, second  
PT oligonucleotide and cleavage agent to form cleavage structure.

XX Example 5; SEQ ID NO 37; 143pp; English.

XX The invention describes a method of analysing nucleic acids comprising  
CC providing a target nucleic acid, e.g. hepatitis C virus nucleic acid  
CC having non-contiguous single-stranded regions (NCSR) separated by an  
CC intervening region, a bridging oligonucleotide capable of binding to the  
CC first and second NCSR; a second oligonucleotide binding to a portion of  
CC the first NCSR and a cleavage agent, and mixing the contents to form a  
CC cleavage structure. The method is useful for analysing nucleic acids,  
CC e.g. hepatitis C virus nucleic acid useful for clinical diagnostic  
CC purposes and detection and identification of pathogenic microorganisms  
CC such as hepatitis C virus. This sequence represents a hepatitis C virus  
CC polynucleotide that is sufficient for identification of HCV subtypes  
CC using the analysis methods of the invention.

XX oligonucleotide and cleavage agent to form cleavage structure.
XX
XX Example 5; SEQ ID NO 32; 143bp; English.
XX
XX The invention describes a method of analyzing nucleic acids comprising
XX providing a target nucleic acid, e.g. hepatitis C virus nucleic acid
XX having non-contiguous single-stranded regions (NCSR) separated by an
XX intervening region, a bridging oligonucleotide capable of binding to the
XX first and second NCSR, a second oligonucleotide binding to a portion of
XX the first NCSR and a cleavage agent, and mixing the contents to form a
XX cleavage structure. The method is useful for analyzing nucleic acids,
XX e.g. hepatitis C virus nucleic acid useful for clinical diagnostic
XX purposes and detection and identification of pathogenic microorganisms
XX such as hepatitis C virus. This sequence represents a hepatitis C virus
XX polynucleotide that is sufficient for identification of HCV subtypes
XX using the analysis methods of the invention.

PT      oligonucleotide and cleavage agent to form cleavage structure.
XX
XX      Example 5; SEQ ID NO 33; 143bp; English.
PS
XX      The invention describes a method of analysing nucleic acids comprising
XX      providing a target nucleic acid, e.g. hepatitis C virus nucleic acid
XX      having non-contiguous single-stranded regions (NCSR) separated by an
XX      intervening region, a bridging oligonucleotide capable of binding to the
XX      first and second NCSR; a second oligonucleotide binding to a portion of
XX      the first NCSR and a cleavage agent, and mixing the contents to form a
XX      cleavage structure. The method is useful for analysing nucleic acids,
XX      e.g. hepatitis C virus nucleic acid useful for clinical diagnostic
XX      purposes and detection and identification of pathogenic microorganisms
XX      such as hepatitis C virus. This sequence represents a hepatitis C virus
XX      polynucleotide that is sufficient for identification of HCV subtypes

XX
XX The invention relates to a method for amplification of a target nucleic
CC acid region in a sample using a specific control sequence. The invention
CC is also directed to a method of determination of a target nucleic acid
CC using a special control nucleic acid. Nucleic acids of the invention are
CC used as a control in a reaction for amplifying target nucleic acids and
CC as a control in a hybridisation reaction for determination of target
CC nucleic acids. The present sequence is HCV (Hepatitis C virus) type 1
CC target DNA. This sequence is used to illustrate the methods of the
CC invention.

PT complex and detecting and characterising the complexes.
XX
XX
XX Example 5; Page 170-171; 279pp; English.
XX
XX The invention relates to methods and compositions of detection and
CC characterisation of nucleic acid sequences and sequence changes. One
CC method of detection and characterisation comprises: (a) providing: (i) a
CC folded target having a DNA sequence comprising at least 1 double stranded
CC region and at least 1 single stranded region; and (ii) at least 1 probe
CC complementary to at least a portion of the folded target; and (b) mixing
CC the target and probes so that the probe hybridises to form a probe
CC /folded target complex. Also provided are methods for determination of
CC structure formation in nucleic acid targets; for analysing folded nucleic
CC acids targets; and for analysis of nucleic acid structures. The methods
CC can be used for the detection and characterisation of nucleic acid
CC sequences to detect the presence of pathogenic nucleic acid sequences
CC indicative of an infection, the presence of variants or alleles of
CC mammalian genes associated with disease and cancers, and the
CC identification of the source of nucleic acids found in forensic samples,
CC as well as in paternity determinations. The methods allow simultaneous
CC analysis of both strands (e.g. the sense and antisense strands) and are
CC ideal for high-level multiplexing. The products produced are amenable to
CC qualitative, quantitative and positional analysis. The methods may be
CC performed in solution or in the solid phase (e.g. on a solid support).

```

CC The methods are powerful in that they allow for analysis of longer  
 CC fragments of nucleic acid than current methodologies. Sequences AAV70453-  
 CC 61 represent partial sequences of different amplicons of hepatitis C  
 CC virus (HCV) subtypes 1a, 1b, 2c and 3a. These partial sequences are used  
 CC for identifying the HCV subtypes

XX Identifying oligonucleotides hybridizing to nucleic acids containing  
PT secondary structure, useful in clinical diagnosis, comprises identifying  
PT primers that interact with the target to form an extension product under  
PT amplification conditions.

XX Example 3; Page 364; 409pp; English.

XX The present invention describes a method for identifying oligonucleotides  
CC with desired hybridisation properties to nucleic acid targets containing  
CC secondary structure. The method comprises amplifying a target nucleic  
CC acid having at least one accessible and one inaccessible site. Primers  
CC that form an extension product are identified as the oligonucleotides  
CC which can interact with the folded target nucleic acid. Oligonucleotides  
CC from the present invention can be used in novel detection methods for  
CC clinical diagnostic purposes, including the detection and identification  
CC of pathogenic organisms (e.g. HIV). The method allows the ability to  
CC rapidly analyse nucleic acid structures. ABL46034 to ABL46367 represent

PT hepatitis, comprises generating fragments of polynucleotides using
PT specific primers and measuring molecular weight of cleaved fragments.
XX
XX Example 4; SEQ ID NO 16; 58bp; English.
PS
XX
XX The invention relates to detecting a mutation. The method involves
CC amplifying a target polynucleotide using a forward primer and a reverse
CC primer; generating fragments of two or more single-stranded
CC polynucleotides including one or more mutations sequence having the size
CC of 2-33 bases by cleaving the amplified target polynucleotide with
CC restriction enzymes, where the second restriction enzyme does not react
CC while a first restriction enzyme is reacted with the amplified
CC polynucleotide; and measuring the molecular weight of the cleaved
CC fragments. The polynucleotide is cleaved to include one mutation among
CC two or more different mutations in only one single stranded
CC polynucleotide fragment and all mutations in the other single stranded
CC nucleotide fragment. Restrictions enzyme treatment step is performed
CC using restriction enzymes having different optimum temperatures. The
CC method is useful in detecting a mutation. The method and primer are
CC useful in diagnosing, prognosis, creating and preventing a disease, e.g.
CC cancer or hepatitis B or C virus. The present sequence represents a HCV
CC 5' NCR (non coding region) template DNA sequence.

PS
XX
XX This is a non-HCV-1 sequence which corresponds to a nucleotide sequence
CC within the 5' untranslated region of HCV-1 of genotype GI1. This sequence
CC (from isolate us4) is identical to that of isolates nac5, arg2, spl, ghl
CC and 115; it differs by one nucleotide from isolate jhl (AAQ31072). The
CC sequence is a preferred example of an oligonucleotide for use as a probe
CC in hybridisation assays, as a primer for synthesis of HCV genotype-
CC specific nucleic acid, as a binding partner for separating HCV nucleic
CC acid or as an antisense oligonucleotide to prevent expression of HCV
CC genes. Polypeptides encoded by oligonucleotides of the invention (no
CC sequences given in the specification) are useful in vaccines against HCV
CC and to produce antibodies to detect the virus. (Updated on 25-MAR-2003 to
CC correct PN field.)

Identifying a compound that increases the mutation rate of hepatitis C virus (HCV) comprises detecting an increase in HCV quasispecies produced by the cell in the presence of the candidate compound.

Example 13; SEQ ID NO 13; 35pp; English.

The invention relates to a method for identifying a compound that increases the mutation rate of hepatitis C virus (HCV), comprising detecting an increase in HCV quasispecies produced by the cell in the presence of the candidate compound by e.g. sequencing HCV nucleic acid molecules isolated from the test cell. The method involves providing a test cell containing a nucleic acid molecule comprising a first nucleotide sequence consisting of an infectious hepatitis C viral genome or its DNA copy, a second nucleotide consisting of a ribozyme or its DNA copy and an inducible promoter operably linked to the first and second nucleotide sequences, where the ribozyme is configured to remove a 3' sequence unnecessary for replication of the hepatitis C viral genome from a transcript initiated by the promoter, inducing the inducible promoter, contacting the test cell with a candidate compound and detecting an increase in HCV quasispecies produced by the cell in the presence of the candidate compound compared to that in the absence of the compound, where an increase in the HCV quasispecies indicates that the compound increases the mutation rate of HCV. The method is useful in identifying compounds that may be used for treating HCV infection. This sequence represents an HCV genomic DNA 5'UTR region used in the method of the invention.

Typing nucleic acid for obtaining information about several variable sites involves simultaneously or sequentially performing two or more primer extension reactions, and determining the pattern of nucleotide incorporation.

Example 1; Fig 2; 86pp; English.

The invention relates to a novel method for obtaining typing information about several variable sites within target nucleic acid, or typing one or more nucleic acid molecules. The methods of the invention are useful for typing one or more nucleic acid molecules containing two or more variable sites, preferably nucleic acid molecules containing three or more variable sites are typed, where three or more primer extension reactions are performed. The method is also useful for diagnosis of pathological conditions characterized by the presence of specific nucleic acid molecule(s). The methods are particularly suited for identifying microbial species or their subtypes, and in typing procedures e.g. typing of polymorphisms, tissue typing or in clinical applications. The sequence represents the 5' untranslated region (UTR) of a hepatitis C virus (HCV) genotype, amplified in the invention to type HCV-positive sera

 PT Identification of strains of microorganisms, by treating nucleic acid  
 PT cleavage structure(s) derived from microorganisms with nuclease to form  
 PT cleavage products(s) and detecting the product(s).  
 XX  
 PS Example 34; Page 164; 303pp; English.  
 XX  
 CC The invention relates to a method of detecting and identifying strains of  
 CC microorganisms by providing a nuclease and a nucleic acid substrate  
 CC containing sequences derived from microorganism(s), treating the nucleic  
 CC acid substrate to form cleavage structure(s) and reacting the nuclease  
 CC with the cleavage structures so that cleavage product(s) are produced.  
 CC The method is used for the identification of strains of microorganisms.  
 CC The microorganism comprises bacteria including Campylobacter,  
 CC Escherichia, Mycobacterium, Salmonella, Shigella or Staphylococcus or a  
 CC virus comprising hepatitis C virus or simian immunodeficiency virus. The  
 CC Mycobacterium comprises strains of multi-drug resistant Mycobacterium  
 CC tuberculosis. The method is less sensitive to size so that entire genes,  
 CC rather than gene fragments, may be analysed. It facilitates the use of  
 CC internal standards for subsequent analysis and data comparison, and  
 CC increases the productivity of personnel and equipment. The present  
 CC sequence represents a Cleavage BN substrate DNA.

XX CC Cleavage of nucleic acids using an enzyme, especially a nuclease selected
XX CC from the group consisting of cleavage (RTM) BN enzyme, Thermus aquaticus
XX CC DNA polymerase, Thermus thermophilus DNA polymerase, Escherichia coli
XX CC ExoIII and the Saccharomyces cerevisiae Rad1/Rad10 complex. The nucleic
XX CC acid substrate is preferably an oligonucleotide containing a human p53
XX CC gene sequence or alternatively, microbial gene sequences. Cleavage
XX CC products are compared to the cleavage products of reference gene
XX CC sequences. The method is used for detecting mutation in the human p53
XX CC gene, for identifying strains of microorganisms, especially bacteria
XX CC selected from the group of members of the genera Campylobacter,
XX CC Escherichia, Mycobacterium, Salmonella, Shigella and Staphylococcus. The
XX CC method may also be used for the identification of viruses, especially
XX CC hepatitis C virus (HCV) and simian immunodeficiency virus (SIV). Four
XX CC primers (AAT29110-113) were used to generate six DNA HCV fragments by RT-
XX CC PCR. The sequence described in AAT29110 is an external antisense primer.
XX CC The sequence described in AAT29111 is a sense primer used after
XX CC termination of the reverse transcription reaction. The remaining two
XX CC primers (AAT29112, AAT29113) were used in a second round of amplification
XX CC reactions which produced a 281 bp product which corresponds to -4 of the
XX CC conserved 5' noncoding region of HCV between positions -284 and -4 of the
XX CC HCV genome. The amplified sequences are described in AAT29116-121

XX PT Identification of strains of microorganisms, by treating nucleic acid
XX PT cleavage structure(s) derived from microorganisms with nuclease to form
XX PT cleavage products(s) and detecting the product(s).
XX PS Example 34; Fig 82; 303pp; English.
XX CC The invention relates to a method of detecting and identifying strains of
XX CC microorganisms by providing a nuclease and a nucleic acid substrate
XX CC containing sequences derived from microorganism(s), treating the nucleic
XX CC acid substrate to form cleavage structure(s) and reacting the nuclease
XX CC with the cleavage structures so that cleavage product(s) are produced.
XX CC The method is used for the identification of strains of microorganisms.
XX CC The microorganism comprises bacteria including Campylobacter,
XX CC Escherichia, Mycobacterium, Salmonella, Shigella or Staphylococcus.
XX CC The virus comprising hepatitis C virus or simian immunodeficiency virus.
XX CC Mycobacterium comprises strains of multi-drug resistant Mycobacterium
XX CC tuberculosis. The method is less sensitive to size so that entire genes,
XX CC rather than gene fragments, may be analysed. It facilitates the use of
XX CC internal standards for subsequent analysis and data comparison, and
XX CC increases the productivity of personnel and equipment. The present
XX CC sequence represents a cleavage BN substrate DNA.

 XX  
 XX Detection and characterisation of nucleic acid sequences - by mixing a  
 PT folded target and one or more probes to form a probe/folded target  
 PT complex and detecting and characterising the complexes.  
 XX  
 XX Example 3; Fig 6; 279pp; English.  
 PS  
 XX The invention relates to methods and compositions of detection and  
 CC characterisation of nucleic acid sequences and sequence changes. One  
 CC method of detection and characterisation comprises: (a) providing: (i) a  
 CC folded target having a DNA sequence comprising at least 1 double stranded  
 CC region and at least 1 single stranded region; and (ii) at least 1 probe  
 CC complementary to at least a portion of the folded target; and (b) mixing  
 CC the target and probes so that the probe hybridises to form a probe  
 CC /folded target complex. Also provided are methods for determination of  
 CC structure formation in nucleic acid targets; for analysing folded nucleic  
 CC acids targets; and for analysis of nucleic acid structures. The methods  
 CC can be used for the detection and characterisation of nucleic acid  
 CC sequences to detect the presence of pathogenic nucleic acid sequences  
 CC indicative of an infection, the presence of variants or alleles of  
 CC mammalian genes associated with disease and cancers, and the  
 CC identification of the source of nucleic acids found in forensic samples,  
 CC as well as in paternity determinations. The methods allow simultaneous  
 CC analysis of both strands (e.g. the sense and antisense strands) and are  
 CC ideal for high-level multiplexing. The products produced are amenable to  
 CC qualitative, quantitative and positional analysis. The methods may be  
 CC performed in solution or in the solid phase (e.g. on a solid support).  
 CC The methods are powerful in that they allow for analysis of longer  
 CC fragments of nucleic acid than current methodologies. The present  
 CC sequence represents a hepatitis C virus (HCV) subtype 1b sequence that  
 CC can be used as a target in the hybridisation analysis using multiple  
 CC capture probes for HCV genotyping

 PT Identifying oligonucleotides hybridizing to nucleic acids containing  
 PT secondary structure, useful in clinical diagnosis, comprises identifying  
 PT primers that interact with the target to form an extension product under  
 PT amplification conditions.  
 XX  
 PS Example 3; Fig 6; 409pp; English.  
 XX  
 CC The present invention describes a method for identifying oligonucleotides  
 CC with desired hybridisation properties to nucleic acid targets containing  
 CC secondary structure. The method comprises amplifying a target nucleic  
 CC acid having at least one accessible and one inaccessible site. Primers  
 CC that form an extension product are identified as the oligonucleotides  
 CC which can interact with the folded target nucleic acid. Oligonucleotides  
 CC from the present invention can be used in novel detection methods for  
 CC clinical diagnostic purposes, including the detection and identification  
 CC of pathogenic organisms (e.g. HIV). The method allows the ability to  
 CC rapidly analyse nucleic acid structures. ABI46034 to ABI46367 represent  
 CC sequences used in the exemplification of the present invention

 PT Analyzing nucleic acids, comprises mixing target nucleic acid such as  
 PT hepatitis C virus nucleic acid, bridging oligonucleotide, second  
 PT oligonucleotide and cleavage agent to form cleavage structure.  
 XX  
 PS Example 3; SEQ ID NO 21; 143pp; English.  
 XX  
 CC The invention describes a method of analysing nucleic acids comprising  
 CC providing a target nucleic acid, e.g. hepatitis C virus nucleic acid  
 CC having non-contiguous single-stranded regions (NCSR) separated by an  
 CC intervening region, a bridging oligonucleotide capable of binding to the  
 CC first and second NCSR, a second oligonucleotide binding to a portion of  
 CC the first NCSR and a cleavage agent, and mixing the contents to form a  
 CC cleavage structure. The method is useful for analysing nucleic acids,  
 CC e.g. hepatitis C virus nucleic acid useful for clinical diagnostic  
 CC purposes and detection and identification of pathogenic microorganisms  
 CC such as hepatitis C virus. This sequence represents a hepatitis C virus  
 CC subtype 1b polynucleotide identified using the analysis methods of the  
 CC invention.

PT secondary structure, useful in clinical diagnosis, comprises identifying
PT primers that interact with the target to form an extension product under
PT amplification conditions.
XX
PS Example 3; Fig 6; 409pp; English.
XX
CC The present invention describes a method for identifying oligonucleotides
CC with desired hybridisation properties to nucleic acid targets containing
CC secondary structure. The method comprises amplifying a target nucleic
CC acid having at least one accessible and one inaccessible site. Primers
CC that form an extension product are identified as the oligonucleotides
CC which can interact with the folded target nucleic acid. Oligonucleotides
CC from the present invention can be used in novel detection methods for
CC clinical diagnostic purposes, including the detection and identification
CC of pathogenic organisms (e.g. HIV). The method allows the ability to
CC rapidly analyse nucleic acid structures. ABL46034 to ABL46367 represent
CC sequences used in the exemplification of the present invention

 CC The invention relates to genomic sequences and amino acid sequences  
 CC corresponding to the non-coding and coding region of a new type of  
 CC Hepatitis C virus (HCV). HCV protein is useful for detecting antibodies  
 CC to HCV and for HCV typing. HCV DNA is useful for detecting the presence  
 CC of HCV virus and for determining the genotype of a HCV virus. Antibody is  
 CC useful for detecting HCV antigens. The invention is useful for preventing  
 CC or treating a HCV infection and is also used in gene therapy. Vaccine is  
 CC useful for immunizing a mammal against HCV infection. The present  
 CC sequence is 16572/2 HCV isolate 5' non-coding region (NCR).

 XX Preparation of RNA samples from plasma - by alcohol precipitation after  
 PT lysis with guanidinium thiocyanate.  
 PT  
 XX Disclosure; Fig 22; 60pp; English.  
 PS  
 XX This DNA sequence comprises an RT-PCR amplification product of hepatitis  
 CC C virus RNA recovered from plasma. A claimed method for preparing RNA  
 CC samples comprises: (a) mixing plasma with an aqueous buffer solution  
 CC containing guanidinium thiocyanate and beta-mercaptoethanol; (b) heating  
 CC the mixture; (c) adding an equal volume of an alcohol to precipitate RNA;  
 CC and (d) recovering the RNA. The method can be used to prepare RNA samples  
 CC for subsequent amplification, especially for detecting pathogens, e.g.  
 CC HCV or HIV. Compared with the known "Isoquick" and "RNAzol" methods,  
 CC the method uses fewer tubes (just one), requires fewer steps, takes less  
 CC time and produces no toxic waste. (Updated on 25-MAR-2003 to correct PF  
 CC field.)

PT Synthetic oligonucleotides complementary to a portion of the 5'

PT untranslated region of hepatitis C virus (HCV), useful for diagnosing and

PT treating HCV infections and hepatocellular carcinoma.  
 XX

PS Disclosure; Fig 1; 74pp; English.

XX The invention describes synthetic oligonucleotides complementary to a  
 CC portion of the 5' untranslated region of hepatitis C virus. The  
 CC oligonucleotides may be used in methods for controlling, preventing, and  
 CC treating hepatitis C virus infection, in antisense technology and gene  
 CC therapy, and of detecting the presence of hepatitis C virus in a sample.  
 CC Hepatitis C virus (HCV) is an enveloped, positive sense, single-stranded  
 CC RNA virus which infects hepatocytes. HCV is the major cause of non-A, non  
 CC -B, acute and chronic hepatitis, and has been associated with  
 CC hepatocellular carcinoma. The invention describes methods and kits for

CC inhibiting replication of HCV, inhibiting the expression of HCV nucleic  
CC acid and protein, and for treating HCV infections. This sequence  
CC represents a hepatitis C virus polynucleotide used as the target for  
CC inhibition of HCV replication and gene expression using the synthetic  
CC oligonucleotides of the invention

PT Novel composition comprising a hepatitis C virus antisense polynucleotide  
PT which is complementary to or corresponds to a sense strand of the virus  
PT genome, and selectively hybridizes to it.  
XX  
PS Example; Fig 14; 75pp; English.  
XX  
CC The specification describes a pharmaceutical composition which comprises  
CC a hepatitis C virus (HCV) antisense polynucleotide. The HCV is  
CC characterized by a positive stranded RNA genome which has 40% homology at  
CC the polypeptide level to a HCV polypeptide. The antisense polynucleotide  
CC binds to cellular polynucleotides which enhance and/or are required for  
CC viral infectivity, replicative ability or chronicity. The antisense  
CC polynucleotides may also be designed to bind with high specificity, to be  
CC of increased stability, to be stable and to have low toxicity. The  
CC composition also comprises an agent which causes viral RNA to be  
CC inactive. The composition is used for preventing HCV replication in a  
CC system. The present sequence represents a novel HCV cDNA sequence, which  
CC is used in the course of the invention

 PT Treating patient with or at risk of hepatitis C virus (HCV) infection by  
 PT inhibiting infection by HCV of and/or replication of HCV in cells of  
 PT central nervous system.  
 XX  
 PS Example 1; Fig 14; 145pp; English.  
 XX  
 CC The present invention relates to a method of treating a patient with or  
 CC at risk of hepatitis C virus (HCV) infection. The method comprises  
 CC inhibiting infection by HCV of, and/or replication of HCV in cells of the  
 CC central nervous system (CNS) of the patient. The method is performed by  
 CC administering to the central nervous system (CNS) a compound capable of  
 CC inhibiting HCV infection and/or replication in the CNS of the patient  
 CC e.g. in monocytes or cells of monocytic lineage. The method is useful for  
 CC treating a patient with or at risk of HCV infection by inhibiting HCV  
 CC infection of and/or replication in cells and non-CNS cells. Preferably,  
 CC HCV infection of and/or replication in microglial cells or circulating  
 CC microglial cell precursors is inhibited. The method is carried out in a  
 CC patient who is, has been or will be administered alpha-interferon. Use of  
 CC a pharmacological agent that blocks binding of the brain-specific  
 CC envelope protein to the putative receptor prevents uptake of the virus to  
 CC the CNS, and improves long-term response rates. Reinfection of the liver  
 CC by the virus released by the CNS may be prevented by the above mentioned  
 CC method. The development of resistant strains is reduced or prevented. By  
 CC before, together with or after antiviral therapy. ABK70867-ABK70886  
 CC represent HCV genome 5'UTR sequences derived from HCV infected patient

 PS Disclosure; Fig 14; 108pp; English.  
 XX  
 CC The present sequence represents an adapted Hepatitis C virus (HCV) 5' non  
 CC translated region (NTR) from a virus of the invention. Only the sequence  
 CC from the 5' base to the ATG initiating the polypeptide is shown. The  
 CC specification describes chimeric viral RNA comprising a 5' nontranslated  
 CC region (5'NTR); an open reading frame (ORF) region; and a 3' NTR; where  
 CC at least one of the regions is chimeric and comprises a nucleotide  
 CC sequence from a pestivirus in operable linkage with a heterologous  
 CC nucleotide sequence, preferably from HCV. The chimeric viral RNA is  
 CC replication-competent. The chimeric viral RNA can be used in a method for  
 CC identifying compounds having antiviral activity against HCV. When the  
 CC pestivirus viral nucleotide sequence is from bovine viral diarrhoea virus  
 CC (BVDV), the chimeric viral RNA can be used in a vaccine against BVDV

XX Treating patient with or at risk of hepatitis C virus (HCV) infection by

PT inhibiting infection by HCV of and/or replication of HCV in cells of

PT central nervous system.

XX Example 1; Fig 14; 145pp. English.

PS The present invention relates to a method of treating a patient with or

CC at risk of hepatitis C virus (HCV) infection. The method comprises

CC inhibiting infection by HCV of, and/or replication of HCV in cells of the  
CC central nervous system (CNS) of the patient. The method is performed by  
CC administering to the central nervous system (CNS) a compound capable of  
CC inhibiting HCV infection and/or replication in the CNS of the patient  
CC e.g. in monocytes or cells of monocytic lineage. The method is useful for  
CC treating a patient with or at risk of HCV infection by inhibiting HCV  
CC infection of and/or replication in cells and non-CNS cells. Preferably,  
CC microglial cell precursors is inhibited. The method is carried out in a  
CC patient who is, has been or will be administered alpha-interferon. Use of  
CC a pharmacological agent that blocks binding of the brain-specific  
CC envelope protein to the putative receptor prevents uptake of the virus to  
CC the CNS, and improves long-term response rates. Reinfection of the liver  
CC by the virus released by the CNS may be prevented by the above mentioned  
CC method. The development of resistant strains is reduced or prevented, by  
CC the therapeutic use of a vaccine against brain-specific envelope protein,  
CC before, together with or after antiviral therapy. ABK70867-ABK70886  
CC represent HCV genome 5'UTR sequences derived from HCV infected patient  
CC BU. Note: Fig 14 page 6 of 6 (page 19/19) is in the incorrect position in  
CC the Fig, and should be page 4 of 6 as the nucleotide numbering of the  
CC sequences on this page follow correctly from page 3 of 6 (page 16/19).  
CC All sequences in Fig 14 have been typed in according to their correct  
CC nucleotide positioning

XX In vitro screening for antiviral agents, from ability to inhibit complex

PT formation between the p110 subunit of translation initiation factor eIF3

PT and region II of the viral internal ribosome binding site.

PS Example 1; SEQ ID NO 1; 45pp; French.

CC The present invention relates to an in vitro method of screening for  
CC compounds (A) that inhibit the formation of a complex between the p10  
CC subunit (ADP20412) of the eukaryotic translation initiation factor eIF3  
CC and region II of the internal ribosome entry site (IRES; ADP20411) of  
CC hepatitis C virus (HCV). Preferably the p10 recognition motif (ADP20414)  
CC and the region II consensus sequence (ADP20412), or fragment of it  
CC containing at least 8 consecutive nucleotides, are used. (A) is  
CC especially an aminoglycoside, specifically tobramycin or an  
CC oligonucleotide antisense to consensus sequence ADP20412, or parts of it.  
CC (A) are used for treating infection by hepatitis C, swine fever and  
CC bovine diarrhoea viruses, also for treating viral or non-viral diseases  
CC which involve proteins synthesis of which is initiated from an IRES, e.g.  
CC cancer. The present sequence is the full-length HCV IRES sequence.

PT Chimeric viral RNA, used in vaccine against BVDV.  
XX  
PS Disclosure; Fig 15; 108pp; English.  
XX  
XX The present sequence represents an adapted Hepatitis C virus (HCV) 5' non  
CC translated region (NTR) from a virus of the invention. Only the sequence  
CC from the 5' base to the ATG initiating the polyprotein is shown. The  
CC specification describes chimeric viral RNA comprising a 5' nontranslated  
CC region (5'NTR); an open reading frame (ORF) region; and a 3' NTR; where  
CC at least one of the regions is chimeric and comprises a nucleotide  
CC sequence from a pestivirus in operable linkage with a heterologous  
CC nucleotide sequence, preferably from HCV. The chimeric viral RNA is  
CC replication-competent. The chimeric viral RNA can be used in a method for  
CC identifying compounds having antiviral activity against HCV. When the  
CC pestivirus viral nucleotide sequence is from bovine viral diarrhoea virus  
CC (BVDV), the chimeric viral RNA can be used in a vaccine against BVDV

 PT Determination of the type of hepatitis C virus present in a sample - by  
 PT restriction enzyme analysis.  
 XX  
 PS Example 1; Page 8; 9pp; Japanese.  
 XX  
 CC A method has been developed to determine the type of hepatitis C virus  
 CC (HCV) present in a sample. The method involves: (a) amplifying the 5' non  
 CC translated region of HCV by PCR; and (ii) cleaving the PCR product with  
 CC three restriction enzymes having different cleavage- recognition sites,  
 CC where the restriction enzymes recognise and cleave the base sequences;  
 CC (i) CCGGG; (ii) CGCG; and (iii) CCGGG; and (c) determining the type of  
 CC HCV based on the cleavage pattern after electrophoresis. The present  
 CC sequence represents the 5' non-coding region of HCV

 XX Identifying a test compound that binds to a target RNA molecule by  
 PT separating the detectably labeled target RNA:support-attached test

PT compound complex from uncomplexed target RNA molecules and test compounds  
PT by flow cytometry.  
XX  
PS Example; Page 60; 131pp; English.  
XX  
CC The invention relates to a novel method for identifying a test compound  
CC that binds to a target RNA molecule comprising separating the detectably  
CC labeled target RNA: support-attached test compound complex from  
CC uncomplexed target RNA molecules and test compounds. The separating  
CC process is carried out by flow cytometry and determining a structure of  
CC the type of test compound of the RNA: support-attached test compound  
CC complex by mass spectrometry. The method is useful for high-throughput  
CC screening of libraries of compounds to identify pharmaceutical leads.  
CC This polynucleotide sequence represents one of the target RNA motifs/  
CC regions of the invention. (Updated on 27-Oct-2003 to standardise OS  
CC field)

PT Identifying a test compound that binds to a target RNA molecule for  
PT treating or preventing amyloidosis, hemophilia, cancer, gigantism,  
PT diabetes, by contacting a detectably labeled target RNA molecule with a  
PT library of test compounds.  
XX  
PS Example; Page 68; 152pp; English.  
XX  
CC The invention relates to a method for identifying a test compound that  
CC binds to a target RNA molecule, which comprises contacting a detectably  
CC labeled target RNA molecule with a library of test compounds under  
CC conditions that permit direct binding of the labelled target RNA to a  
CC member of the library of test compounds so that a detectably labeled

CC target RNA: test compound complex is formed. The method is useful for  
CC screening libraries of compounds for those that are selectively bind to a  
CC pre-selected target RNA. The compounds are useful for inhibiting the  
CC formation of a specific bound RNA: host cell factor complexes in vivo.  
CC They are also useful for treating or preventing diseases associated with  
CC overproduction or decreased protein function, such as amyloidosis,  
CC haemophilia, Alzheimer's disease, atherosclerosis, cancer, gigantism,  
CC inflammation, hypothyroidism, hyperthyroidism, autoimmune disorders, aging,  
CC dwarfism, cystic fibrosis, diabetes, obesity, neurodegenerative  
CC disorders, Parkinson's disease or infections (bacterial, viral, fungal).  
CC The invention is also used in gene therapy. The present sequence is human  
CC internal ribosome entry site (IRES) RNA. This sequence is used to  
CC illustrate the method of the invention

PT Treating patient with or at risk of hepatitis C virus (HCV) infection by  
PT inhibiting infection by HCV of and/or replication of HCV in cells of  
PT central nervous system.  
XX  
PS Example 1; Fig 14; 145pp; English.  
XX  
CC The present invention relates to a method of treating a patient with or  
CC at risk of hepatitis C virus (HCV) infection. The method comprises  
CC inhibiting infection by HCV of, and/or replication of HCV in cells of the  
CC central nervous system (CNS) of the patient. The method is performed by  
CC administering to the central nervous system (CNS) a compound capable of  
CC inhibiting HCV infection and/or replication in the CNS of the patient  
CC e.g. in monocytes or cells of monocytic lineage. The method is useful for  
CC treating a patient with or at risk of HCV infection by inhibiting HCV  
CC infection of and/or replication in cells and non-CNS cells. Preferably,  
CC HCV infection of and/or replication in microglial cells or circulating  
CC microglial cell precursors is inhibited. The method is carried out in a  
CC patient who is, has been or will be administered alpha-interferon. Use of

CC a pharmacological agent that blocks binding of the brain-specific  
CC envelope protein to the putative receptor prevents uptake of the virus to  
CC the CNS, and improves long-term response rates. Reinfection of the liver  
CC by the virus released by the CNS may be prevented by the above mentioned  
CC method. The development of resistant strains is reduced or prevented, by  
CC the therapeutic use of a vaccine against brain-specific envelope protein,  
CC before, together with or after antiviral therapy. ABK70867-ABK70886  
CC represent HCV genome 5'UTR sequences derived from HCV infected patient  
CC BU. Note: Fig 14 page 6 of 6 (page 19/19) is in the incorrect position in  
CC the Fig, and should be page 4 of 6 as the nucleotide numbering of the  
CC sequences on this page follow correctly from page 3 of 6 (page 16/19).  
CC All sequences in Fig 14 have been typed in according to their correct  
CC nucleotide positioning

PS Example 3; Page 11; 14pp; Japanese.  
XX  
CC The primers AAQ98270-94 are used in a novel simple method for the  
CC detection of hepatitis C virus. The novel method involves the steps of  
CC extracting the virus from a sample, synthesizing cDNA from the viral RNA  
CC by reverse transcription, amplifying the cDNA by a first PCR and  
CC reamplifying the amplified product in a second PCR, all of which occur in  
CC a single reaction tube. The primers are designed based on a 334 bp  
CC sequence (AAQ98272) derived from a 5' non-translated region of the viral  
CC genome

CC HCV infection of and/or replication in microglial cells or circulating  
CC microglial cell precursors is inhibited. The method is carried out in a  
CC patient who is, has been or will be administered alpha-interferon. Use of  
CC a pharmacological agent that blocks binding of the brain-specific  
CC envelope protein to the putative receptor prevents uptake of the virus to  
CC the CNS, and improves long-term response rates. Reinfection of the liver  
CC by the virus released by the CNS may be prevented by the above mentioned  
CC method. The development of resistant strains is reduced or prevented, by  
CC the therapeutic use of a vaccine against brain-specific envelope protein,  
CC before, together with or after antiviral therapy. ABK70867-ABK70886  
CC represent HCV genome 5'UTR sequences derived from HCV infected patient  
CC BU. Note: Fig 14 page 6 of 6 (page 19/19) is in the incorrect position in  
CC the Fig, and should be page 4 of 6 as the nucleotide numbering of the  
CC sequences on this page follow correctly from page 3 of 6 (page 16/19).  
CC All sequences in Fig 14 have been typed in according to their correct  
CC nucleotide positioning

PS  
XX  
XX The present invention relates to a method of treating a patient with or  
CC at risk of hepatitis C virus (HCV) infection. The method comprises  
CC inhibiting infection by HCV of, and/or replication of HCV in cells of the  
CC central nervous system (CNS) of the patient. The method is performed by  
CC administering to the central nervous system (CNS) a compound capable of  
CC inhibiting HCV infection and/or replication in the CNS of the patient  
CC e.g. in monocytes or cells of monocytic lineage. The method is useful for  
CC treating a patient with or at risk of HCV infection by inhibiting HCV  
CC infection of and/or replication in cells and non-CNS cells. Preferably,  
CC HCV infection of and/or replication in microglial cells or circulating  
CC microglial cell precursors is inhibited. The method is carried out in a  
CC patient who is, has been or will be administered alpha-interferon. Use of  
CC a pharmacological agent that blocks binding of the brain-specific  
CC envelope protein to the putative receptor prevents uptake of the virus to

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

 Seeds were surface sterilized then germinated under aseptic  
 conditions in the dark at room temperature on filter paper  
 with water, nystatin and cefotaxime in covered  
 crystallization dishes. Five-day old seedlings were  
 incubated at 50C for 2 days. Shoots were then harvested,  
 total RNA was prepared, poly(A) RNA was purified, one  
 primary unamplified cDNA library was made, and 600000 pfu  
 were in vivo excised to give plasmid library  
 phagemids. These steps were performed in the TU Close  
 Laboratory at the University of California, Riverside  
 (Choi, Close, Fenton). Phagemids were plated and picked at  
 the Clemson University Genomics Institute (CUGI) (Begum,  
 Palmer, Friesch, Atkins and Wing). Plasmid DNA  
 preparations, DNA sequencing and sequence analysis were  
 performed at CUGI (Wing, Yu, Friesch, Henry, Simmons,  
 Oates, Rambo, Main). The sequence has been trimmed to  
 remove vector sequence and contains a minimum of 100 bases  
 of phred value 20 or above. For more details on library  
 preparation and sequence analysis see  
 http://www.genome.clemson.edu/projects/barley. To order  
 this clone see http://www.genome.clemson.edu/orders also

Cloned unidirectionally. Poly(A)+ RNA was concentrated and purified  
using Dynabeads (Dyna1) and mRNA eluted for first strand synthesis.  
First strand cDNA was created using MMLV RT (Powerscript, Clontech)  
and primed with oligo(dT) with XhoI site and 5'SMART 'anchor' added  
using chimeric DNA-RNA oligo. 12 PCR cycles were done using first  
strand and primers specific to SMART oligo and 3' end. Double  
stranded cDNA was digested using XhoI/NotI, fractionated on  
Chroma-spin 400 columns (Clontech) and ligated to digested  
pGEM-11zf(+) plasmid. Chemically competent DH10B cells were used as  
host cells. Library materials provided by Dr. David Bird of North  
Carolina State University. Library construction by Jeff Rousch. See  
www.nematode.net for additional project information.

 /note="Vector: PMD42nv; Purified genomic DNA from M. musculus C57BL/6J (male) was obtained from the Jackson Laboratory Mouse DNA Resource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptor DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of PMD42 (g14732114[g147329072.1]), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptor mouse DNA was annealed to adaptor vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

 /note="Vector: pSPORT1; Site 1: NotI; Site 2: SalI; This cDNA library was constructed from mRNA isolated from somatic embryos (age ranging from 2 months to 9 months) cultured on MSD 20. The library was prepared using the life Technologies superscript cDNA library construction kit. Complementary DNA was synthesized from mRNA using a poly (dT) sequence with a NotI restriction site. SalI linkers adapters were ligated to the blunt-ended cDNA fragments followed by NotI digestion. The cDNA fragments were directionally cloned into the NotI-SalI restriction site of the pSPORT1 vector. The ligated cDNA fragments were transformed into E.coli Electromax DH10B host cells. This library was constructed in the laboratory of Dr. Lila Vodkin by Anu Khanna at the University of Illinois at Urbana-Champaign. e-mail: l-vodkin@uiuc.edu"

Cloned unidirectionally. Poly(A)+ RNA was concentrated and purified using Dynabeads (Dynal) and mRNA eluted for first strand synthesis. First strand cDNA was created using MMLV RT (Powerscript, Clontech) and primed with oligo(dT) with XhoI site and 5'SMART 'anchor' added using chimeric DNA-RNA oligo. 12 PCR cycles were done using first strand and primers specific to SMART oligo and 3' end. Double stranded cDNA was digested using XhoI/NotI, fractionated on Chroma-spin 400 columns (Clontech) and ligated to digested pGEM-11zf(+) plasmid. Chemically competent DH10B cells were used as host cells. Library materials provided by Dr. David Bird of North Carolina State University. Library construction by Jeff Rousch. See [www.nematode.net](http://www.nematode.net) for additional project information.

/note="Organ: Bark (with phloem and cambium attached) from one year old clonal trees grown under greenhouse conditions in standard potting soil mixture. Vector: pBluescript II SK (+) XR; Site 1: EcoRI (5' end of cDNA); Site 2: XhoI (3' end of cDNA); Bark was wounded using razor blades along the entire length of the tree at 5 mm intervals on opposite sides of the trunk. The same trees were also sprayed with a 0.01% (v/v) methyl jasmonate solution resuspended in 0.1% (v/v) tween 20 (50mls per tree). Bark tissue with phloem attached was harvested 3 hours, 6 hours, 12 hours, 24 hours, 2 days, 4 days and 8 days after initiating the treatment. Untreated control bark was also harvested at time 0 hours. mRNA was isolated from each tissue source independently and equal quantities of mRNA from each tissue were then pooled. cDNA was prepared from 5 micrograms of mRNA and directionally ligated into the pBluescript II SK (+) XR vector using the pBluescript II XR cDNA Library Construction Kit according to manufacturer's instructions with modifications (Stratagene). Plasmid DNA was then transformed by electroporation into DH10B cells (Invitrogen) for propagation. Normalization was applied according to published methods [Bonaldi M.F. et al. (1996) Genome Research 6(9):791] in order to reduce the abundance of highly expressed transcripts."

/note="vector: pBluescript II SK+, Site\_1: EcoRI, Site\_2: XhoI; The cDNA library was constructed from mRNA isolated from differentiating somatic embryos cultured on MSM6AC. The library was prepared using the Stratagene pBluescript II SK(+) library construction kit. Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dT) sequence with an XhoI restriction site. EcoRI adaptors were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The cDNA fragments were directionally cloned into the EcoRI-XhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into E.coli ElectroMax DH10B host cells. Tissue culture and library construction were performed by Françoise Thibaud-Nissen and Anu Khanna (Lila Vodkin lab, University of Illinois)."

Cloned unidirectionally. Poly(A)+ RNA was concentrated and purified  
using Dynabeads (Dyna) and mRNA eluted for first strand synthesis.  
First strand cDNA was created using MMV RT (PowerScript, Clontech)  
and primed with oligo(dT) with xhoi site and 5'SMART 'anchor' added  
using chimeric DNA-RNA oligo. 12 PCR cycles were done using first  
strand and primers specific to SMART oligo and 3' end. Double  
stranded cDNA was digested using XhoI/NotI, fractionated on  
Chroma-spin 400 columns (Clontech) and ligated to digested  
pGEM-11zf(+) plasmid. Chemically competent DH10B cells were used as  
host cells. Library materials provided by Dr. David Bird of North  
Carolina State University. Library construction by Jeff Rousch. See  
www.nematode.net for additional project information.  
Seq primer: Sp6.

/organism="Zea mays"  
/mol\_type="mRNA"  
/db\_xref="taxon:4577"  
/clone\_lib="zmrw848"  
/note="Samples were collected in Robert E. Sharp's lab (University of Missouri-Columbia) to construct three normalized cDNA libraries. Dark-grown maize seedlings with primary roots 12-20 mm in length were transplanted to high (-0.03 MPa) or low water potential (-1.6 MPa) vermiculite, and harvested at 5 h and 48 h after transplanting. About 1,000 roots were used for each of the low water potential libraries (zmrw805 and zmrw848) while 500 roots were combined from each of the two time points at high water potential (zmrw00). Each root was divided into 4 segments (distances are from the junction of the root apex and root cap): segment 1, 0-3 mm plus the root cap; segment 2, 3-7 mm; segment 3, 7-12 mm; segment 4, 12-20 mm. (For details of conditions see (1) with nutrient modifications as in (2)). The three normalized cDNA libraries were constructed in the lab of Hans Bohnert (University of Illinois-UC). Total RNA was extracted by the 'hot phenol' method (Plant Molecular Biology manual, D5: 1-13, 2nd ed., 1997). This method worked in eliminating carbohydrate material present in the root tips. The integrity of the RNA was verified by denaturing agarose gels and spectrophotometry (ratio A260/280). Poly(A)+mRNA was isolated twice from total RNA using the Oligotex Direct RNA kit (Qiagen). Poly(A)+mRNA was converted to double-stranded cDNA and tagged by using modified Oligo(dT) primers. One of 4 sequence tags corresponding to a different segment of the root was added to the 3'-end of the modified Oligo(dT) primers, including a NotI site and used to reverse transcribe the segment-specific mRNAs into cDNAs. Each library contains all four tags. A suffix (s1, s2, s3, or s4) has been added to each sequence identifier to designate which region of the root (Root segment 1, 2, 3, or 4) the sequence was found in based on the identification of the tag. A suffix of 80 indicates that the sequence tag, and hence the source segment, could not be identified. The double stranded cDNAs were size-selected (>450 bp). Size selected cDNAs were adapted with EcoRI adaptors at both ends, and then digested with NotI. The cDNA was directionally cloned into EcoRI-NotI digested pBS II SK(+) phagemid vector (Stratagene) and electroporated into E. coli DH10B. The total number of white colony forming units (cfu) in the primary libraries before amplification was as follows: zmrw805: 3.37 x 10<sup>6</sup>; zmrw848: 4.87 x 10<sup>6</sup>; zmrw00: 3 x 10<sup>6</sup>. The background of empty clones was less than 1%. Inserts ranged from -0.5 kb to >2.5 kb, as determined by PCR. Plasmid DNA from the primary libraries then was converted to single-stranded circles and used as a template for PCR amplification using the T7 and T3 priming sites that flank the cloned cDNA inserts. The purified PCR products, representing the entire cDNA population cloned in each library, were used as a driver for normalization. Hybridization between the single-stranded library and the PCR products was carried out for 44 hours at 300C. Non-hybridized single-stranded DNA circles were separated from hybridized DNA rendered partially double-stranded and electroporated into DH10B. The total number of clones with insert was: zmrw805: 2.0x10<sup>7</sup>; zmrw848: 4.2x10<sup>7</sup>; zmrw00: 1.1x10<sup>7</sup>. The background of empty clones was less than 2%. Insert size, determined by PCR of the entire library, ranged from 0.5 kb to 2.5 kb. (1) Sharp R E; Silk W K; Hsieh T C. Growth of the Maize Primary Root at Low Water Potentials I.             Cloned unidirectionally. Poly(A)+ RNA was concentrated and purified
            using Dynabeads (Dynal) and mRNA eluted for first strand synthesis.
            First strand cDNA was created using MMV RT (Powerscript, Clontech)
            and primed with oligo(dT) with XhoI site and 5'SMART 'anchor' added
            using chimeric DNA-RNA oligo. 12 PCR cycles were done using first
            strand and primers specific to SMART oligo and 3' end. Double
            stranded cDNA was digested using XhoI/NotI, fractioned on
            Chroma-spin 400 columns (Clontech) and ligated to digested
            pGEM-11ze(+) plasmid. Chemically competent DH10B cells were used as
            host cells. Library materials provided by Dr. David Bird of North
            Carolina State University. Library construction by Jeff Rousch. See
            www.nematode.net for additional project information.

 mid-log phase in TAP-N (30 min, 1hr, 4hr), TAP-S (30 min, 1hr, 4hr), TAP-P (4hr, 12hr, 24hr), NO3 to NH4 (30min, 1hr, 4hr) and NH4 to NO3 (30min, 1hr, 4hr). PolyA mRNA was purified from each sample, pooled and cDNA synthesized. The cDNA was directionally cloned into lambda Zap II (Stratagene) in the EcoRI (5') and XhoI (3') sites. Bluescript II SK- plasmids were excised from the lambda Zap clones by superinfection with ExAssist (Stratagene) phage. The library was normalized using method 4 described in Bonaldo et al (1996) Genome Research 6: 791-806."

Seeds were surface sterilized then germinated under axenic  
conditions in the dark at room temperature on filter paper  
with water, nystatin and cefotaxime in covered  
crystallization dishes. Five-day old seedlings were  
incubated at 90% RH for 24 hr. Shoots were then harvested,  
total RNA was prepared, poly(A) RNA was purified, one  
primary unamplified cDNA library was made, 600000 pfu were  
in vivo excised to give plasmid SK(-) cDNA phagemids.  
These steps were performed in the TU Close laboratory at  
the University of California, Riverside (Choi, Close,  
Fenton). Phagemids were plated and picked at the Clemson  
University Genomics Institute (CUGI) (Begum, Palmer,  
Frisch, Atkins and Wing). Plasmid DNA preparations, DNA  
sequencing and sequence analysis were performed at CUGI  
(Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main).  
The sequence has been trimmed to remove vector sequence  
and contains a minimum of 100 bases of phred value 20 or  
above. For more details on library preparation and  
sequence analysis see  
<http://www.genome.clemson.edu/projects/barley>. To order

 RNA prepared and library constructed by W. Walter Lorenz (School of Forest Resources, University of Georgia); plant material prepared by Craig Zimmermann (School of Forest Resources, University of Georgia)

Georgia) using rooted cuttings provided by the Forest Biology Research Cooperative (FBRC) and the CLONES project at the University of Florida; sequencing done in the Laboratory for Genomics and Bioinformatics, University of Georgia. Sequence ends have been trimmed to exclude vector and regions below phred quality 16. Three-prime sequences are presented as their reverse complement and have been trimmed to exclude polyA.  
 Seq primer: JENREV (GAGGAACGCTATACC).

 /note="Organ: Root; Vector: pSL1180; Site 1: EcoRI; Site 2: XhoI; The library was prepared from polyA+ RNA from the roots of 1-year-old loblolly pine (Pinus taeda) cuttings that were rooted and then planted in washed sand. The rooted cuttings were maintained for 117 days (July 2003 harvest) under ambient conditions in a local greenhouse. They were kept on a weekly regimen of 0.5x nutrient-complete Hoagland's solution and supplemented with additional water sufficient to maintain a 15% soil moisture content. For twenty-eight days (28 d) prior to harvesting roots for mRNA preparation, the trees received Hoagland's solution lacking potassium (K) to induce a potassium-deficiency. Double-stranded cDNA was cloned unidirectionally into pSL1180. Inserts can be excised with EcoRI (5' end) and XhoI (3' end)."

/note="Vector: pBluescript II KS(+); Site 1: EcoRI;  
Site 2: NotI. This normalized library was constructed from  
1 million independent clones. cDNA synthesis was initiated  
using an oligo(dT) primer, using methylated C in the first  
strand synthesis reaction. Following this first strand  
reaction, double-stranded cDNA was blunt-ended, ligated to  
NotI adapters, digested with EcoRI, size-selected, and  
cloned into the NotI and EcoRI compatible sites of a  
custom modified MCS of the pBluescript (KS+) vector. The  
library was normalized in 2 rounds using conditions  
adapted from Soares et al., PNAS (1994) 91: 9228-9232 and  
Bonaldo et al., Genome Research 6 (1996): 791, except that  
a significantly longer reannealing hybridization was  
used."

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

## RESULT 100

US-09-825-574-26/c

Sequence 26, Application US/09825574

Patent No. 6709819

GENERAL INFORMATION:

APPLICANT: Lyamichev, Victor I.

Fors, Lance P.

Neri, Bruce P.

TITLE OF INVENTION: Polymorphism Analysis By Nucleic Acid

Structure Probing With Structure-Bridging Oligonucleotides.

NUMBER OF SEQUENCES: 51

CORRESPONDENCE ADDRESS:

ADDRESS: MEDLEN &amp; CARROLL, LLP

STREET: 220 Montgomery Street, Suite 2200

CITY: San Francisco

STATE: CA

COUNTRY: USA

ZIP: 94104

COMPUTER READABLE FORM:

MEDIUM TYPE: Floppy disk

COMPUTER: IBM PC compatible

OPERATING SYSTEM: PC-DOS/MS-DOS

SOFTWARE: Patentin Release #1.0, Version #1.30

; APPLICANT: Brechot, Christian  
; APPLICANT: Kremsdorf, Dina  
; APPLICANT: Porchon, Colette  
; TITLE OF INVENTION: Nucleotide and Peptide Sequences of a  
; TITLE OF INVENTION: Hepatitis C Virus Isolate, Diagnostic and Therapeutic  
; NUMBER OF SEQUENCES: 46  
; CORRESPONDENCE ADDRESS:  
; ADDRESSEE: Finnegan, Henderson, Farabow, Garrett &  
; ADDRESS: 1300 I Street, N.W.  
; STREET: 1300 I Street, N.W.  
; CITY: Washington  
; STATE: DC  
; COUNTRY: USA  
; ZIP: 20005-3315  
; COMPUTER READABLE FORM:  
; MEDIUM TYPE: Floppy disk  
; COMPUTER: IBM PC compatible  
; OPERATING SYSTEM: PC-DOS/MS-DOS  
; SOFTWARE: Patentin Release #1.0, Version #1.25  
; CURRENT APPLICATION DATA:  
; APPLICATION NUMBER: US/08/487,231  
; FILING DATE: 07-JUNE-1995  
; CLASSIFICATION: 435  
; PRIOR APPLICATION DATA:  
; APPLICATION NUMBER: US 07/965,285  
; FILING DATE: 18-MAR-1993  
; CLASSIFICATION: 435  
; PRIOR APPLICATION DATA:  
; APPLICATION NUMBER: FR 91 06 882  
; FILING DATE: 06-JUN-1991  
; ATTORNEY/AGENT INFORMATION:  
; NAME: Meyers, Kenneth J.  
; REGISTRATION NUMBER: 25,146  
; REFERENCE/DOCKET NUMBER: 05286-0001-02000  
; TELECOMMUNICATION INFORMATION:  
; TELEPHONE: 202-408-4000  
; TELEFAX: 202-408-4400  
; INFORMATION FOR SEQ ID NO: 26:  
; SEQUENCE CHARACTERISTICS:  
; LENGTH: 256 base pairs  
; TYPE: nucleic acid  
; STRANDEDNESS: single  
; TOPOLOGY: linear  
; MOLECULE TYPE: Other  
; DESCRIPTION: cDNA to genomic RNA

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

Direct Submission  
Submitted (24-MAR-2000) Whitehead Institute/MIT Center for Genome  
Research, 320 Charles Street, Cambridge, MA 02141, USA  
On May 2, 2000 this sequence version replaced gi:7549706.  
All repeats were identified using RepeatMasker:  
Smit, A.F.A. & Green, P. (1996-1997)  
http://ftp.genome.washington.edu/RM/RepeatMasker.html

Center clone name: 338_I_9

* NOTE: This record contains 76 individual
* sequencing reads that have not been assembled into
* contigs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced.
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that
* the record is updated, the accession number will
* be preserved.
*

Center clone name: 537\_I\_16

NOTE: This record contains 278 individual  
\* sequencing reads that have not been assembled into  
\* contigs. Runs of N are used to separate the reads  
\* and the order in which they appear is completely  
\* arbitrary. Low-pass sequence sampling is useful for  
\* identifying clones that may be gene-rich and allows  
\* overlap relationships among clones to be deduced.  
\* However, it should not be assumed that this clone  
\* will be sequenced to completion. In the event that  
\* the record is updated, the accession number will  
\* be preserved.

Center project name: L24474

Center clone name: 320\_J\_5

NOTE: This record contains 77 individual sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will be preserved.

 -----  
 NOTE: This record contains 87 individual

* sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allow overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will be preserved.

 TITLE  
 JOURNAL  
 Submitted (11-OCT-2002) Human Genome Sequencing Center, Department  
 of Molecular and Human Genetics, Baylor College of Medicine, One  
 Baylor Plaza, Houston, TX 77030, USA  
 On Oct 9, 2002 this sequence version replaced gi:21736578.  
 The sequence in this assembly is a combination of BAC based reads  
 and whole genome shotgun sequencing reads assembled using Atlas  
 (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described  
 in the feature table below represents a scaffold in the Atlas  
 assembly (a 'contig-scaffold'). Within each contig-scaffold,  
 individual sequence contigs are ordered and oriented. The sequence  
 by sized gaps filled with Ns to the estimated size. The sequence  
 may extend beyond the ends of the clone and there may be sequence  
 contigs within a contig-scaffold that consist entirely of whole  
 genome shotgun sequence reads. Both end sequences and whole genome  
 shotgun sequence only contigs will be indicated in the feature  
 table.

 Direct Submission  
 2 (bases 1 to 235173)  
 Worley,K.C.  
 Direct Submission  
 Submitted (21-FEB-2002) Human Genome Sequencing Center, Department  
 of Molecular and Human Genetics, Baylor College of Medicine, One  
 Baylor Plaza, Houston, TX 77030, USA  
 On Nov 15, 2002 this sequence version replaced gi:23367822.  
 The sequence in this assembly is a combination of BAC based reads  
 and whole genome shotgun sequencing reads assembled using Atlas  
 (<http://www.hgsc.bcm.tmc.edu/projects/rat/>). Each contig described  
 in the feature table below represents a scaffold in the Atlas  
 assembly (a 'contig-scaffold'). Within each contig-scaffold,  
 individual sequence contigs are ordered and oriented, and separated  
 by sized gaps filled with Ns to the estimated size. The sequence  
 may extend beyond the ends of the clone and there may be sequence  
 contigs within a contig-scaffold that consist entirely of whole  
 genome shotgun sequence reads. Both end sequences and whole genome  
 shotgun sequence only contigs will be indicated in the feature  
 table.

----- Genome Center  
 Center: Baylor College of Medicine  
 Center code: BCM  
 Web site: <http://www.hgsc.bcm.tmc.edu/>  
 Contact: hgsc-help@bcm.tmc.edu  
 ----- Project Information  
 Center project name: GOU5  
 Center clone name: CH230-119823  
 ----- Summary Statistics  
 Assembly program: Phrap, version 0.990329  
 Consensus quality: 196107 bases at least Q40

```

Consensus quality: 201820 bases at least Q30
Consensus quality: 205011 bases at least Q20
Estimated insert size: 193547; sum-of-contigs estimation
Quality coverage: 5x in Q20 bases; sum-of-contigs estimation
-----
* NOTE: Estimated insert size may differ from sequence length
* (see http://www.hgsc.bcm.tmc.edu/docs/genbank\_draft\_data.html).
* NOTE: This is a "working draft" sequence. It currently
* consists of 5 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.
*
* 1 224145: contig of 224145 bp in length
* 224146 224245: gap of unknown length
* 224246 228440: contig of 4195 bp in length
* 228441 228540: gap of unknown length
* 228541 230920: contig of 2380 bp in length
* 230921 231020: gap of unknown length
* 231021 233289: contig of 1269 bp in length
* 233290 233389: gap of unknown length
* 233390 235173: contig of 2784 bp in length.

-----  
\* NOTE: This record contains 61 individual  
\* sequencing reads that have not been assembled into  
\* contigs. Runs of N are used to separate the reads  
\* and the order in which they appear is completely  
\* arbitrary. Low-pass sequence sampling is useful for  
\* identifying clones that may be gene-rich and allows  
\* overlap relationships among clones to be deduced.  
\* However, it should not be assumed that this clone  
\* will be sequenced to completion. In the event that  
\* the record is updated, the accession number will  
\* be preserved.

\* and the order in which they appear is completely  
\* arbitrary. Low-pass sequence sampling is useful for  
\* identifying clones that may be gene-rich and allows  
\* overlap relationships among clones to be deduced.  
\* However, it should not be assumed that this clone  
\* will be sequenced to completion. In the event that  
\* the record is updated, the accession number will  
\* be preserved.

----- Project Information
Center project name: L7950
Center clone name: 25_B_7
-----
* NOTE: This record contains 82 individual
* sequencing reads that have not been assembled into
* contigs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced.
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that
* the record is updated, the accession number will
* be preserved.

Project Information

Center project name: L9026

Center clone name: 222\_B.7

NOTE: This record contains 76 individual  
 sequencing reads that have not been assembled into  
 contigs. Runs of N are used to separate the reads  
 and the order in which they appear is completely  
 arbitrary. Low-pass sequence sampling is useful for  
 identifying clones that may be gene-rich and allows  
 overlap relationships among clones to be deduced.  
 However, it should not be assumed that this clone  
 will be sequenced to completion. In the event that  
 the record is updated, the accession number will  
 be preserved.

Center clone name: 68\_N\_17

\*\*\*\*\* NOTE: This record contains 88 individual  
\* sequencing reads that have not been assembled into  
\* contigs. Runs of N are used to separate the reads  
\* and the order in which they appear is completely  
\* arbitrary. Low-pass sequence sampling is useful for  
\* identifying clones that may be gene-rich and allows  
\* overlap relationships among clones to be deduced.  
\* However, it should not be assumed that this clone  
\* will be sequenced to completion. In the event that  
\* the record is updated, the accession number will  
\* be preserved.

\*\*\*\*\*  
\* NOTE: This record contains 88 individual  
\* sequencing reads that have not been assembled into  
\* contigs. Runs of N are used to separate the reads  
\* and the order in which they appear is completely  
\* arbitrary. Low-pass sequence sampling is useful for  
\* identifying clones that may be gene-rich and allows  
\* overlap relationships among clones to be deduced.  
\* However, it should not be assumed that this clone  
\* will be sequenced to completion. In the event that  
\* the record is updated, the accession number will  
\* be preserved.
